Subject: Circuit to add odd offsets to IC24
Message-ID: <57.UUL1.3#1@vortex.COM>
Date: 8 Oct 90 20:41:00 GMT
Organization: Vortex Technology
Lines: 32

On the assumption that no method exists to program odd repeater offsets into the 24, I took a look at the schematics to see if it would be practical to add such functionality. It appears that it might well be.

The simplest technique would seemingly be to program the transmit and receive frequencies of interest in two adjacent simplex memory channels. A circuit would then be needed to bump the channel up when PTT is pressed and back down when PTT is released. Since it takes a significant fraction of a second for carrier to come on when PTT is pushed, the channel switch should occur before transmission actually begins.

The rotary channel selector simply provides an up or down pulse to the logic each time the knob is turned. The circuit under discussion would provide this same pulse based on the PTT operation. Of course, a means to activate and deactivate this function (perhaps by an "invalid" combination of keyboard buttons pressed simultaneously) would also be needed.

One nice thing about this concept is that it would involve little or no work on the PC boards, but could be almost totally interfaced at the PTT and rotary switches. Building the circuit small enough to fit in the unit might be a challenge, but there actually is some room in the area of the UT-50 PL encoder/decoder card.

The real question is, has anyone attempted this before, or done
anything like it? And of course, if it turns out there *is* some way
to program the odd offset directly, this would all (happily) be an
academic discussion.

H> What is needed is a nationwide standard repeater code for accessing
H> emergency services...

J> It is easy to find out the 911 emergency codes for almost every repeater
J> in the state of Hawaii. ...everyone has nearly standardized on one of
J> the following: 911, *911, or *9.

A ham friend who represents a local club (Northern Colorado ARC) to the CCARC (Colorado Congress (?) of ARCs) tells me the statewide convention is:

911*

That works on three of the four patches of which I'm a member, but I think the fourth one is "*911" (I might be wrong about that).

Re: "What do we lack? A distress frequency."

On which band? Unlike many radio services, there are many different ham bands.

I'll assume you mean 2M. A problem I see is that many times the best frequency to use is a repeater, especially from an HT. Unfortunately, for some strange reason, repeaters are spread around all different frequencies. :-)

Seriously, as a ham who travels with an HT, if I have an emergency I'd rather try to hit a repeater than call on a simplex distress frequency.

What is ARRL doing about restrictive covenants? PRB-1 doesn't have anything to do with those.

> WHAT!!?!? Is he hallucinating? When did the ARRL invest in a
> shortwave broadcast station?

Perhaps he means W1AW, which "broadcasts" legal one-way

transmissions that are supposed to be of interest to the amateur
community (plus code practice) on several amateur shortwave bands.
W1AW was just extensively (and expensively) renovated and operates
using top-line commercial-grade radio and computer equipment.

I do read QST. That's how I know all this.

Of course, the police agency would immediately dispatch someone
to your stated location anyway just to find out why you are on their
radio system.

> the modified IC-2GE would be a mere subject of his construction
> project... Remember, ham gear don't have to be type approved, if it is
> not meant to be sold.

BUT... any equipment used on police or other non-amateur
frequencies MUST BE type accepted. Using modified ham gear outside
the ham bands is ILLEGAL, no matter how many public-spirited EMTs and
others are carrying them on their belts.

Just got some flyers from Sony. They have a new (I mean I only
know it now) model of radio, the CRF-V21.

Does anyone has any experience/comments on it.

Bernard Chang.

The ham club at New Jersey Institute of Tech in Newark operates K2MFF/R on
147.225.

HT's monitoring this machine suffer from severe intermod. The signal from
another local repeater mixes with the signal from a mobile phone (not cell
phone - the old kind), creating a new signal on 147.225. The end result is
that you can listen to both the other repeater and Newark Mobile Phone
conversations at the same time. The intermod is strong enough to drown
out K2MFF/R.

The intermod is caused by signals mixing INSIDE the HT's. Mobile/base
tranceivers do not suffer from this problem.

A few days ago, my ICOM-751 developed a Memory-storage problem....
..it would store properly so long as you kept the same "mode", but
when trying to store a different mode (such as changing from usb to
lsb) all previous storages were wiped out. I was preparing myself for
the painful task of shipping it out for repair, when I fortunately
overheard a ham conversation on the air from a person who worked at
a place that sold ham-gear. He had heard something about "holding
down the WRITE button", while turning the transceiver on (initial
power-up). I tried it and IT CURED MY PROBLEM! Apparently, it resets
or initializes some logic??

Wow, I had no idea ... how does this work? I are they "cellular" in nature (the 15 or 20 don't overlap much)? This is a pretty good sort of "multipath" effect, how does it not foul up the receivers? (FM generates awful squeaks when you've got 2 comparable-strength x-mitters going at once)

Another "welcome" to you Michael.

I agree with your sentiments regarding 5 WPM difficulty. I'm working on 20 WPM now, and the same thing applies - speed improves through regular practice and motivation. The only difference is that I'm going through more paper and ink. :)

Athletes and musicians know that practice and "luck" are positively correlated. While there are people on this Net that viscerally disagree about the CW requirement, remember that everyone can have an opinion, even if it is wrong. (Geez, guys, lighten up ! :)

> Not quite. You can just call your nearest repeater (isn't that why you have your rig?) and either dil 911 directly or have someone do it. That way, you won't have to explain your call. If you make an unauthorized call, you will spend a lot of time explaining to the dispatcher, or whomever, who you are, and why you're calling them directly. If it's precious seconds you're trying to save, you surely won't do it this way. And if it's *my* life you're trying to save please don't use this means. By the time you get through the hassle I'll probably have been carried to the hospital by a real Ham.

1. Not all repeaters have autopatches.

2. Sometimes no one is on frequency who can call for you.

3. Sometimes some windbag is on the frequency.

4. If you do get someone calling for you, there is the added delay and distortions of them relaying messages back and forth. The operators on each end (The ham on site and the dispatcher) don't get the

benefit of direct contact, such as detecting levels of stress.

If I have my IC-32AT with me, I can be on the local fire/rescue/medical frequency in just 3 seconds.

I believe that if you *DO* follow the standard procedures that they use on the radio, the dispatcher is more likely to sooner accept the communcations as that of an authentic emergency. The procedures work to save time as well. But if you don't know them, don't try to fake them. The dispatchers are trained to deal with communications with ordinary people as well, though it would be over the phone on a dedicated full duplex communication line. For that reason, simplex autopatches can be a problem as well. Using ordinary phone communications procedures over the radio can end up tying up the frequency which might be needed to actually dispatch the rescue.

If you find you must use such a frequency, I believe the following would be good advice:

0. Don't panic.

1. Give the dispatcher some sort of handle to call you by, so they can ask you to get back on frequency when they have a question to ask you. Do NOT give your ham call as this handle because it is not something they are readily prepared to deal with (unless you get LUCKY and the dispatcher is a ham). A good simple handle could be "ham operator".

   I happen to have an agency code and number they are familiar with and plan to use that.

2. BEFORE you get on the frequency, make an assesment of the situation. Know the LOCATION and the number and types of injuries. If we are talking "mass casualty" still give them NUMBERS. Estimate if you must, but numbers are important.

3. When you get on the frequency, address the dispatcher as everyone else does, give your "handle" and indicate you have "emergency traffic" or "an emergency situation" or whatever it is.

4. Let THEM handle the radio procedures such as clearing the frequency. Once you make contact, stay off the radio unless called or there is an important change in the situation. If you call them, address them in the usual manner and let them acknowledge you or as their common procedures go.

The other problem is if you get a 32S? or 73S? with a worn out
PTO or a bum rotary switch. I spent several days in grad school
replacing these switches -- you know, the switched with 6.02 x 10**23
contacts.

The Purdue ARC had wisely ordered new replacements from Collins
in the mid 1970s. Even then they were expensive, and they sat
in the closet for a few years waiting until for installation.
I drew a complete wiring diagram for each switch (noting wire colors)
before snipping the first wire.

It took a lot of work, but was somehow worth it. Those S-Line radios
just oozed quality.

My personal CW receiver preference was for the Drake R-4C over the 75S3
series, but I liked the Collins 32S transmitter over the T-4XC due to
ease of tuneup and a fondness for 6146s.

I too have had no luck doing this. If anyone knows the magic key
combination that allows removing a memory, please share this with
us...

IMHO, this is a minor nit, however. I am quite happy with the
radio in almost every other respect. The main gripe I have is
the outrageous prices Kenwood charges for their battery packs...

Here's some fat for the code test/difficulty fire: a year or so

ago, I met someone who had learned the code in the military. He told
me that 25 WPM was the _ENTERING REQUIREMENT_ for the radioman school,
and that it was held that even people who were NO GOOD AT CODE could
attain it. People who were good at code could aspire to yet higher
speeds....

A couple months ago, I posted a request for a VOX circuit. I would like to thanks those who helped me find that info I was looking for.

I am now looking for a used FM band exciter (88-108 Mhz) and a stereo generator or schematic and construction information for such devices. Used devices would have to be cheap and working. The schematics would have to be solid state and of recent vintage. ANY help would be appreciated! You can mail any info to:

P.O.Box 1286
Lakewood, NJ 08701

Thanks!

I am looking for general coverage transmit mods for both the Kenwood TM-621 and TM-731. The mod for the 621 is a specific one. The 621 will transmit up to 151.995 with the mere CAP mod. I am in search of the mod to go above 152 (to about 155.00 MHz). Now I am aware the the 721 will go the full swing when 2 shorts are applied to the board which is behind the front panel.
I have attempted this same mod to the 621 and it does not work at all.
If anyone knows if the shorts are different in the 621 or of another process to extend it I would appreciate it.
With regard to the 731, I am interested in the mods for both UHF and VHF.

Any other mods would also be appreciated. If you can help me, please
contact me here or at PO Box 1286
Lakewood, NJ 08701

Many thanks, Chris

How wonderful it must befor all the parochial types that have a local repeater and are initiated in the secret access codes of the autopatch. But there is one thing that the amateur radio service does not have, despite all the saving lives chatter. Funny though cos CB has it, as do ships and aircraft.

What do we lack? A distress frequency. One that works across the U.S., so if I fall in a hole in Chicago I can get help without having to make friends first.

I bring this up every now and again and am usually ignored. Kinda nice to know though that my pilot doesn't have to look through his Jeppesens to find a tower freq when the plane starts making funny noises. Must be comforting for ships' officers too not to have to try and read the pilot as waves crash across the bow and flames leap up the superstructure. Those sailor boys even got a Morris distress freq - Now there's an idea that might catch on.

Yours, probably the only amateur without a local repeater where they talk to me.

> After all of the anti-Morse flames, I found it refreshing to hear from a
> newcomer who found the code test an interesting challenge, and not something
> to be totally OUTRAGED about.

That aspect of his post was interesting. I am all for anyone choosing a challenge, and pursuing it the best that they can. But I hold just as much respect for someone who can recognize what they cannot achieve, and not wasting their own time in futile attempts. However not everyone has the ability to know exactly what they can and cannot do, and certainly no one knows these things about everyone else.

```
> Of course, some folks just can't sit still while an opinion like this
> is expressed.  I have found in the past that when I express the opinion
> on rec.ham-radio or fidonet that I like Morse, and don't consider an
                                (1)^^^^^^^^^^^^   (2)^^^^^^^^^^^^^^^^^
> exam such an OUTRAGE, I usually get some flames from people who act as
  ^^^^^^^^^^^^^^^^^^^^
> if *I* invented the code test!  They usually take this misconception
> rather personally, as though to have an opinion on anything somehow
> is directed toward THEM.
```

There is absolutely nothing wrong with Morse Code, or as you mention in number (1), liking Morse Code.

There is also nothing wrong with having a Morse Code exam, as you mention in number (2).

However, the above two issues have NOTHING TO DO WITH the issue that has usually brought about the debate and the flames.

```
The outrage is in actually requiring someone to take and pass one of those
    ^^^^^^^(my opinion)
Morse Code tests just to get access to a controlled public resource when
the code is not an essential skill to make proper use of that resource.
```

If you disagree with the above statement I made, then that is the difference in our opinions. The communications of these opinions is made difficult by the confusion between the different subissues. For instance, people seem to be associating:

```
        "I like Morse Code"  <==>  "Let's keep the code requirement"
        "I hate Morse Code"  <==>  "Let's get rid of the code requirement"
```

and these associations are TOTALLY INCORRECT. The same applies with the matter of whether or not Morse Code is easy.

I believe it is these types of issue-confusions that make not only ham radio related issues difficult to understand or resolve, but also affect major general issues like abortion, pornography, gun control, difficult to deal with.

In the abortion arena, I am BOTH Pro-Choice AND Pro-Life. These are NOT conflicting positions, but most people think they are and they are thus confused, not just on what my opinion/position is, but on what the issues are and how they relate to each other. [ask me more by email if confused]

Most of you are fully aware that my position is in favor of a "code free" ham radio license. However, that does NOT mean I am in any way against code. The term "no code" is probably THE major culprit in the many misunderstandings that have taken place in this matter. What the words mean in English does not describe the people that believe in the position that it is often labeled as.

Tad, please let us know what you do believe in; what your opinions are.

Opinions themselves are not subject to debate, because they represent what you are, and that is simply fact about you. What could be subject to debate are the facts you might use in support of your opinion. Some might believe the fact to be in error, or that they do not apply. More often there are many facts tugging the issue in many directions, and the weights we apply to each are the big differences. Those who disagree with your opinions might believe you based them without the benefit of fact. If you want to do that, that's your right. If you have used facts and logic as your basis, stating them can preempt debate on lack of facts.

There is probably no way to avoid any debate as long as a difference of opinion exists. Some of us are hoping to converge on a common understanding. That is possible even with no change in opinion.

Does anyone know of any mods for the Kenwood TM-411A? In particular, expanding receive coverage from 438-450 MHz to 430-450 MHz, or even wider? There's one obvious problem - it only has a '1s' MHz digit and uses a small LED to indicate the 43x MHz range.

[paramedic mode on]
While I think that it's great that the patients survived, reading this
produced only one thought:

PLEASE DON'T REMOVE PEOPLE FROM WRECKED CARS!!!!!

Doing so without proper training can make whatever injuries the patient has
much, much worse. It's far better to leave them wherever they are until
trained personnel can stabilize them and move them safely. The only time you
should move an injured person is if they are in immediate danger, like the
car being actually on fire, or about to slide off of a cliff. Note that
merely leaking fluid does not mean the car is in immediate danger; more
often than not, that fluid is radiator coolant or battery acid. Cars simply
don't blow up like they do after every accident on TV. If in doubt, DON'T.
[paramedic mode off]

Having said that, I agree: that kind of thing is what ham radio is all about.

I see that Patty has supplied answers, so I'll just expand on the last question: I did. Not alone, but in concert with the SAREX Working Group, with the strong support of Ron Parise and the other ham astronauts and that of the NASA Public Affairs people (who are largely responsible for SAREX being aboard the Shuttle at all).

The point behind SAREX is: 1) to promote amateur radio to the public, and 2) to promote the manned space program. (You can guess which of these is ARRL's and AMSAT's interest and which NASA's!) We (the Working Group) came to the conclusion that the best way of doing that was to ensure school participation in the program. Contacts by individual amateurs from their basements are a secondary function inasmuch as they do considerably less to promote A.R. and the space program. Aside from the desire to get the "biggest bang for the buck," so to speak, we had some concern as to how much support we would continue to get from NASA if the project addressed only the (limited in numbers) ham community. But the ham community hasn't been ignored; if you want a SAREX QSL, you can get one by making a packet connection. It shouldn't be too hard.

There is nothing wrong with "regular" QSOs on an as-time-permits basis. But on STS-35 there will be very little time available when the Shuttle is over the U.S. STS-37 should be better in this regard, and we have prospects for even better setups on later flights. (For example, one future flight has _four_ currently licensed hams scheduled to be aboard, with another crew member possibly working on getting licensed. The Johnson Space Center ARC has done a superb job getting the crew members interested and licensed.) So I suspect that you'll have more and better opportunities in the future.

But the primary mission, ASTRO, is scheduled for those periods. It's an
astronomy mission that prefers to see the night sky, so nighttimes are
pretty well taken up with ASTRO. (Ron, WA4SIR, is a payload specialist,
meaning his main job is operating the ASTRO payload. SAREX is very much
secondary.) The reason AMSAT has coordinated worldwide relay to the
schools is because Ron's SAREX time is mostly when he's on the other side
of the world!

But I think if you look closer you'll see that the private-station operation
referred to was the packet operation.

It's always a good idea to listen before you transmit, but in fact a
600 kHz offset is being used between the SAREX transmit and receive
frequencies. (Don't forget to set the "-600" mode on your rig...)
Other terrestrial users would definitely appreciate our not transmitting
when the shuttle is not in view or not in packet mode, however.

It may be that recent bulletins haven't stressed this point, but I'm
sure earlier ones (like last spring) gave the schedule. Maybe a repost
is needed. Also I think the information in QST made it clear that there
would be few opportunities for non-school voice/SSTV contacts. Again,
that was published last spring (actually, I think it was February), so
it may not have been remembered. I think you're right--the multiple
delayed launch attempts have gummed up the works.

Maybe it's the fact that Lo-Jack operates on 173.something MHz.
Now we can ask, what is keeping them from buying a frequency counter,
or using the portable scanner that all those criminal types have ;-)
to monitor the nationwide Lo-Jack frequency?

> 1) Does anyone know what the deal is with the STS-35 shuttle mission?

Postponed until at least November due to unresolved Hydrogen leaks in the orbiter aft compartment. Discovery now has launch priority and at this writing is in the countdown process on Pad 39B.

> 2) I finally passed my Novice and Technician exams! (Four days apart from each other). Does anyone know what the call signs being given in ITU region 1 are at the Extra level? If I am able to go for my Extra by the end of this year, or early next year, will I receive a 2x1/1x2 or 2x2 call?

Congratulations. I don't believe the USA is in ITU Region 1. I'm pretty sure we are in Region 2. In any case, it's not the ITU that issues amateur callsigns to individual stations. The FCC still has plenty of callsigns left in the 1st Call District, which is what I presume you really meant. Better study the regulatory structure just a little harder. This is not a flame or put-down. One of the major arguments against entry-level licenses is that people can get on the air without knowing some of the basics.

> 3) Does anyone know HOW radio amateurs became known as 'Hams'?
> Is there a rational reason for the term?

Hey, that's two questions! ;-)

Lots of people claim to "know" the origin of the term "ham" but they all have different stories. Rational? Dunno...

It may be for the FAA's domestic HF backup network.

No, you weren't asked. The ARRL is not a pure democracy but a representative democracy. That means you vote for the candidate for Director who most appeals to your Amateur Radio goals. What's that you say? There was only one candidate for Director in your division? Hmmm...makes you wonder how committed the complainers really are, doesn't it? It's not that hard to become a candidate: just get a petition signed by ten (!) ARRL members of your division.

It's by no accident that the form of representation of ARRL is somewhat like that of the U.S. Government (among other semi-respected organizations). It's the most workable system yet discovered. But like government, it depends on the participation of the people. All too few ARRL members participate. (Of course, nonmembers can't paticipate at all. Oddly, some of them take great pride in their nonparticipation.)

Oh, by the way, ARRL HQ has fewer staff now than it did a few years ago. Times are tight, and staff cuts save money. ('Course, services are reduced, too.) I don't recall hearing you complain about not being consulted when the cuts were made...

Let me guess. It has an ARRL diamond enclosed in a circle with a slash bar across the middle. ;-)

FWIW, I have been an ARRL member since 1981 (my first year licensed) and have just renewed my own membership. I am annoyed at the Board minutes in last month's issue detailing the creation of several new paid staff positions at HQ. I don't recall being asked if I wanted to hire anybody else.

If somebody can point out a reference in QST where members were _asked_ in advance about adding more salaries to the ARRL budget, please do so. I will then take a hunk of humble pie into my library to read it.

Yes... just use the 'func-set' button, and then choose the desired step size that you would like, in the amateur bands you have the choice of 5, 10, 12.5, 15, and 25 KHz (maybe even 50KHz, I am doing this from my memory, and may be slightly off)... Note that you may have to use the up/down arrows (or is it the vfo knob, again with the memory problems) to choose the step size parameter. I think (again) that the tuning step size is shown with the mnemonics 'TS' in the display... consult your manual (it is in there).

The radio is realy versatile (sp?), you can change almost anything (when operating in the amateur bands, for some reason during 'out of band receiving' the step size does not allow as great a selection (I have noticed this in the 220 MHz and 8xx MHz range).

Hope this helps,

Rich (NM1D)

David.Stark@f218.n260.z1.FIDONET.ORG (David Stark) complains:

FWIW, I have been an ARRL member since 1981 (my first year licensed) and have just renewed my own membership. I am annoyed at the Board minutes in last month's issue detailing the creation of several new paid staff positions at HQ. I don't recall being asked if I wanted to hire anybody else.

If somebody can point out a reference in QST where members were _asked_ in advance about adding more salaries to the ARRL budget, please do so. I will then take a hunk of humble pie into my library to read it.

73 de Dave, NF2G

Well, what's the alternative? You want them to mail a letter to each of, what, 200000 members to ask about it? They'd have to supply the return postage, otherwise you'd complain about that, so 200000 round-trips is about $100,000 spent polling the members about a (guessing) $20,000 job at ARRL HQ?   It's like electing a gumment and then complaining about what they do once they are in power (I know, there's no opposition party in this case, but we vote for the guys that make the decisions).

And anyway, how can you *read* humble pie? (a low blow, admittedly...)

Query: The location of any fusible links, or diodes used as such.

I'm hoping someone in net land can help me with this, as there are a few at least out there with some cardnial knowledge on Bendix/King handy talkies, as the manufacturer obviously enjoys the right to not make such details known to the general electronics populus.

(As near as I can tell) I tapped 2 contacts on the 8 pin port of a Bendix/King HT while releasing 2 contacts used for programming. The Bendix went to sleep; But I don't think any IC went, as it plain shutdown, no brain damage noted. (Tones, faulted display, gentle smoking, etc)

I was told there was a thin wire used as such a fuse, nothing found matching that idea, the battery pack is fine, and the circuty from the battery to switch (as well as PC board) is complete. I haven't located any part matching the stadard Buss surface mount fuses. (Yes, the whole radio is surface mount components, double sided boards, populated on both sides, IE Simple Repair Hell.)

While I'm on the subject, anyone know of any modifications to this radio, or keypad & non-standard programming tricks (like holding keys at powerup, like many 2m HTs?)

I was a radio operator qualified in Morse Code when I was in the military
many moons ago. I went to the school twice over a long period of time.
The requirements in the army were not that high unless you showed aptitude
and got grabbed by the spooks. But as an interesting point as far as
who can and can't learn the code, the failure rate was better than 50%
and when you figure this was during the peak of Vietnam and the alternative
for a draftee who didn't make was straight into the Infantry, it appears
that even with a lot of incentive, a lot of people can't really do it.
By the way, 10WPM was enough to graduate from the school. If you were
good, they didn't hold you back and they did have qualifiers for people
who topped 20 WPM.

It might be instructive to consider a slightly different situation.
You come upon a car accident involving a police car where the officer has been knocked unconscious. Do you reach into the police car, grab the mic, and call for help on the police radio?

My answer is NO, if I have two meters available, and YES if there is no other means of communication handy.

I think the bottom line is: Is this such a dire emergency that it will be worth it even if I get into trouble for it?

A couple of people have reacted less than maturely over the issue of code tests and whether copying dits and dahs, then translating is an allowable test method. Two points:

1. There is nothing in the testing rules I can find that prohibits this method. In fact, the elmer that helped me through the Novice code suggested that 5 WPM speed is slow enough to do it.

2. Regardless of a VE's motives, if he/she imposes a more strict requirement on code testing, and fails someone because he/she doesn't like their methods, he/she has exceeded their authority, and will likely do far more to damage the reputation of ham radio in the eyes of the non-ham community than they achieve by acting as VE's.

I think the idea of suing is ridiculous. We have enough frivolity in our civil courts now without adding this. As one person suggested, find another VE, or find someone in the examination chain to complain to. There is nothing to be gained for ham radio from having VE's, either old farts (or young farts) who are intent on "maintaining the purity of the code requirement."

A copy of the new DOC exam syllabus landed on my desk this afternoon. I had it scanned in, and I'm posting it here for general information purposes.

I don't want to re-open the no code debate, but I think the anti-no coders (phew!) would do well to take a look at the new certificates just brought in by the DOC.

[Any spelling or formatting errors are mine.]

Enjoy.

Information on the Amateur Operators Certificate Examinations

RIC-24
Issue 2
July 1, 1990

Communications Canada
Radio Regulatory Branch
300 Slater Street
OTTAWA, Ontario
K1A 0C8

_G_E_N_E_R_A_L _I_N_F_O_R_M_A_T_I_O_N

The hobby of amateur radio, today more than ever, is an extension of scientific knowledge applied to telecommunications. The Department of Communications believes that amateur radio should be accessible, so that those who are interested in the science and art of radiocommunication may avail themselves of every reasonable opportunity to learn, enjoy and contribute to its progress.

The department also recognizes the necessity for amateur operators to have some technical and operating knowledge before being allowed on the amateur radio bands. This circular outlines basic information for individuals who wish to become amateur radio operators.

Anyone may become an amateur radio operator; there are no age or nationality restrictions. The best way to learn about amateur radio is to enroll in a class taught by amateur radio operators or clubs. Information on these courses is available from the three amateur associations listed below. Study guides, question banks, technical books, Morse code tapes and other publications relating to amateur radio, are available from these organizations for a fee.

Canadian Amateur Radio Federation
P.O. Box 356
KINGSTON, Ontario
K7L 4W2
Tel: 613-545-9100

Canadian Radio Relay League
Box 7009, Station "E"
LONDON, Ontario
N5Y 4J9
Tel: 519-660-1200

Radio Amateur du Quebec Inc. (RAQI)
4545 Pierre-de-Courbetin Avenue
P.O. Box 1000, Station "M"
MONTREAL, Quebec
H1V 3R2 Tel: 514-252-3012/252-3000 ext. 3422

While the scope and depth of the knowledge required are described on the following pages in general terms, the exact requirements for the various qualifications can be obtained by referring to the appropriate bank of questions.

Anyone may use an amateur radio station, provided a qualified operator is in attendance to pertorm the control functions. Getting to know radio amateurs in your area and practising on their stations is an excellent way to learn about operating practices, station assembly, regulations, radio frequency propagation, antennas and a host of directly related data.

_C_E_R_T_I_F_I_C_A_T_E_S _A_N_D _P_R_I_V_I_L_E_G_E_S

There is only one certificate available for the amateur service: the Amateur Operator's Certificate. The holder of this certificate may obtain as many as four levels of qualification. The Basic Qualification is required before an individual may operate an amateur radio station in Canada or hold a licence for such a station. The following paragraphs describe how to obtain each of the four levels of qualification and the privileges accorded to those who have reached these levels.

_P_L_E_A_S_E _N_O_T_E that no operating privileges are accorded the holder of the Morse Code Qualifications (5 w.p.m. and 12 w.p.m.) or the holder of the Advanced Qualification unless the holder also possesses the Basic Qualification.

_B_a_s_i_c _Q_u_a_l_i_f_i_c_a_t_i_o_n

Basic Qualification provides the foundation for operation in the amateur radio service. To obtain the Amateur Operator's Certificate with Basic Qualification, a candidate must successfully complete a theory/regulations/operating procedures examination.

The holder of the Amateur Operator's Certificate with the Basic Qualification may:

1. operate on all frequencies above 30 MHz, using all classes of emissions,

2. use a maximum of 250 watts DC transmitter input power, and

3. build and operate all station equipment except for "home-made" transmitters.

_M_o_r_s_e _C_o_d_e (_5 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

The examination for this qualification requires the candidate to be able to send and receive Morse code at a speed of not less than 5 words per minute.

The holder of this qualification enjoys all the privileges granted to those who have reached the basic level of qualification. In addition, he or she may operate in all amateur frequency bands below 4.0 MHz, using all classes of emissions.

_M_o_r_s_e _C_o_d_e (_1_2 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

The examination for this qualification requires the candidate to be able to send and receive Morse code at a speed of not less than 12 words per minute.

The holder of this qualification, in addition to the basic privileges, may operate on all amateur frequency bands below 30 MHz, using all classes of emissions.

_A_d_v_a_n_c_e_d _Q_u_a_l_i_f_i_c_a_t_i_o_n

Advanced Qualification is for those individuals who have an in-depth knowledge of electronics, a good knowledge of the various types of amateur equipment and an understanding of the functioning of circuits that will enable them to make repairs.

The holder of the Advanced Qualification, in addition to the basic privileges, may:

1. build and operate transmitting equipment,
2. use maximum transmitter power of 1000 watts DC input,
3. sponsor repeaters and club stations, and
4. remotely control fixed stations, including the use of radio links.

_E_X_A_M_I_N_A_T_I_O_N _R_E_Q_U_I_R_E_M_E_N_T_S

_B_a_s_i_c _Q_u_a_l_i_f_i_c_a_t_i_o_n

The theory questions in the Basic Qualification examination require basic component analysis. Other subjects are examined at the concept or system level, rather than at a detailed circuit analysis level.

_B_a_s_i_c _E_l_e_c_t_r_o_n_i_c_s

Candidates must:

1. understand the basic concepts and relationships of conductors, insulators, direct current, alternating current, electromotive force, resistance, power, capacitance, inductance, reactance, impedance and resonance;
2. be able to define Ohm's law and be able to do simple calculations using it;

3. be able to explain the function of a battery, a transformer, an AC power supply, and the basic blocks of a simple transmitter, receiver and transceiver; and

4. be able to identify diodes, transistors, integrated circuits and vacuum tubes, as well as the circuits for which they are used, and be able to describe their basic purpose.

_P_r_o_p_a_g_a_t_i_o_n _a_n_d _A_n_t_e_n_n_a _S_y_s_t_e_m_s

Candidates must be able to describe:

- sunspots, sunspot cycle, solar radiation, ionosphere, fading, absorption, refraction, radiation angle, multi-hop, MF/HF propagation, VHF/UHF propagation, transmission lines, antenna types, antenna impedance, standing wave ratio (SWR) and matching devices.

_l_n_t_e_r_f_e_r_e_n_c_e _a_n_d _S_u_p_p_r_e_s_s_i_o_n

Candidates must be able to:

1. describe and give examples of how to suppress front-end overload, audio rectification, harmonics, parasitics and intermodulation products;

2. explain the use and be able to show placement of low-pass, high-pass, band-pass and band reject filters; and

3. explain the purpose of shielding and how it is accomplished.

_S_t_a_t_i_o_n _A_s_s_e_m_b_l_y

Candidates must be able to:

1. explain the basic function of transmitters, receivers, transceivers, SWR bridges, power supplies, fuses, operational control settings and interconnecting cables;

2. explain how to achieve good grounding and lightning protection; and

3. show the proper position in relation to one another of the various pieces of equipment that may be found in an amateur radio station.

_O_p_e_r_a_t_i_o_n_s, _P_r_o_c_e_d_u_r_e_s _a_n_d _R_e_g_u_l_a_t_i_o_n_s

Candidates must:

1. be able to explain operational procedures for voice radiocommunications, Morse code transmission of messages, RTTY, AMTOR, packet transmission, repeater use, slow-scan and fast-scan television, as well as other modes of operation;

2. be able to explain the international and domestic regulations governing the operation of an amateur radio station;

3. demonstrate a good knowledge of the Q code signals described in Radiocommunication Information Circular 25 (RlC-25), which contains extracts from the Radio Regulations of the I.T.U., the Radiocommunication Act, and the General Radio Regulations, Part II, affecting the Amateur Service; and

4. be able to recognize the emergency signals and indicate what procedures should be followed in their use (distress and urgency).

_M_o_r_s_e _C_o_d_e (_5 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

Candidates must demonstrate their ability to send by hand and receive by ear, international Morse Code at a speed of not less than 25 characters per minute (Swords per minute) for a period of not less than three consecutive minutes.

_M_o_r_s_e _C_o_d_e (_1_2 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

Candidates must demonstrate their ability to send by hand and receive by ear, international Morse Code at a speed of not less than 60 characters in one minute (12 words per minute) for a period of not less than three consecutive minutes.

_A_d_v_a_n_c_e_d _Q_u_a_l_i_f_i_c_a_t_i_o_n

This examination focuses on circuits and components, rather than on systems.

_C_i_r_c_u_i_t _A_n_a_l_y_s_i_s

Candidates will be expected to explain the use and operation of: oscillators, radio frequency amplifiers, buffers, multipliers, mixers, intermediate frequency amplifiers, detectors, discriminators, audio frequency amplifiers, filters, speech amplification and processing as well as power supplies and regulation.

_T_r_a_n_s_m_i_t_t_e_r_s, _R_e_c_e_i_v_e_r_s, _L_i_n_e_a_r _A_m_p_l_i_f_i_e_r_s _a_n_d _M_o_d_u_l_a_t_i_o_n _T_e_c_h_n_i_q_u_e_s

Candidates must be able to:

1. describe transmitting, receiving and modulating principles for the following: continuous wave, single sideband, ACSB, AM, FM/PM, pulse, fast-scan and slow-scan television, RTTY, AMTOR, packet, translators, repeaters and satellites;

2. explain the terms sensitivity, selectivity, stability, noise figure and dynamic range;

3. explain in detail direct conversion and superheterodyne receivers; and

4. describe the use and operation of class AB1, AB2 and B linear amplifiers and class A and class C amplifiers.

_P_r_o_p_a_g_a_t_i_o_n _a_n_d _A_n_t_e_n_n_a _S_y_s_t_e_m_s

Candidates must be able to describe in detail:

- ionospheric layers, sporadic "E", aurora borealis, meteor scatter, EME transmission, tropospheric bending, VSWR, baluns, matching networks, transmatches, coaxial cables, balanced lines, velocity factor; dipole, Yagi quad and trap antennae; grounding, groundplane, virtual height, radiation resistance, mirror image, and other propagation-related information.

_T_e_s_t _E_q_u_i_p_m_e_n_t _a_n_d _C_o_n_s_t_r_u_c_t_i_o_n

Candidates must be able to explain the use or function of:

- multimeters, VSWR bridges, marker generators, frequency counters, dip meters, two-tone audio generators, dummy or artificial antennae, oscilloscopes, signal generators, attenuators, spectrum analyzers, and other test equipment.

_C_E_R_T_I_F_I_C_A_T_E _E_X_A_M_I_N_A_T_I_O_N_S

If candidates wish to be examined for the Basic or Advanced Qualification or to take the Morse code examinations given by a radio inspector, they must make an appointment at any district office of the Department of Communications. Some district offices prefer to give the examination at a school or meeting hall, especially when a group, such as an amateur radio class, is involved. However, small groups and individuals are usually examined at the local district office. A fee of five dollars ($5.00) is charged for each qualification when the examination is given by a department official. To find the district office nearest you, please refer to your telephone directory.

Where necessary, examiners can help and make special arrangements for candidates who have physical disabilities. It is much easier for all concerned if such requests are made when the appointment is made.

When an examination is failed because the candidate's language is neither English nor French, or because academic limitations restrict the ability to read the questions properly, an oral examination may be administered. A decision of this nature can be made only by a radio inspector.

Private groups, such as amateur clubs or organizations, may also give amateur certificate examinations. The department recognizes that when such private groups give the examinations, costs are incurred since they must procure facilities and provide the necessary services. The department understands the need to recover costs, but wishes to underline that these charges are not levied on behalf of the department.

_W_R_I_T_T_E_N _E_X_A_M_I_N_A_T_I_O_N_S

For a written examination, each candidate will be supplied with a booklet containing the questions, formulae as required, and an answer sheet. The candidate must supply name, address and other related information. The candidate may use mathematical tables and/or a non-programmable calculator to complete the examination, but these will not be supplied by the examiners.

Before the examination begins, the examiner will allow a few minutes for briefing purposes. After the examination begins, no questions will normally be permitted. The pass mark is 60 percent.

_B_A_S_I_C _Q_U_A_L_I_F_I_C_A_T_I_O_N _E_X_A_M_I_N_A_T_I_O_N

The examination is comprised of 100 multiple choice questions. At least 25 of these are based on domestic and international regulations; the remainder on test theory and operating procedures.

_A_D_V_A_N_C_E_D _Q_U_A_L_I_F_I_C_A_T_I_O_N _E_X_A_M_I_N_A_T_I_O_N

This examination consists of 50 multiple choice questions based on advanced radio theory.

_M_O_R_S_E _C_O_D_E _E_X_A_M_I_N_A_T_I_O_N

The Morse code examination is in plain language and may include the twenty-six letters, the ten numbers, punctuation marks (comma, period, question mark, dash and fraction bar), Q-signals and emergency signals. In both the sending and receiving examinations, each character omitted, incorrectly sent or received, is counted as one error. A mark of 100 percent is awarded for five errors or less, 99 percent for 6, 98 percent for 7, 97 percent for 8, etc. The examiner will allow two minutes for candidates to review and correct their copy before it is graded. The pass mark is 100 percent.

A candidate writing the exam for the Morse Code (12 w.p.m.) Qualification, who does not already have the Morse Code (5 w.p.m.) Qualification, will be awarded the Morse Code (5 w.p.m.) Qualification without further examination if a mark of over 60% (fewer than 45 errors) on both sending and receiving is achieved.

Delegated examiners are available in many areas to give the Morse code and written examinations. They may be contacted through amateur radio clubs, technical schools and other organizations. Information on delegated examiners and copies of Radiocommunication Information Circular 1 (RlC-1), Guide for Delegated Examiners, are available from your local district office of the Department of Communications.

_M_I_S_C_E_L_L_A_N_E_O_U_S

Existing amateurs who hold the Amateur Radio Operator's Certificate or the Amateur Radio Operator's Advanced Certificate are deemed, by regulation, to hold the basic, Morse code (12 w.p.m.) and advanced levels of qualification. Those who hold the Amateur Digital Radio Operator's Certificate are deemed, also by regulation, to hold the Basic and Advanced Qualifications.

Any person holding a Canadian Radiocommunications Operator's General Certificate, a Canadian Radio Operator's

First Class Certificate or a Canadian Radio Operator's Second Class Certificate may apply for a licence, good for all qualifications and privileges, without further examination. Any person holding a Canadian Radiotelephone Operator's General Certificate, (Aeronautical, Maritime or Land), may apply for a licence without further examination, but privileges are limited to those of the Basic Qualification.

A candidate for the Amateur Operator's Certificate examinations may be examined for any qualification, in any order, but candidates may not apply for a licence until they have passed the Basic Qualification examination.

As previously mentioned, many amateur clubs and organizations provide instructional classes for individuals interested in becoming radio amateurs. In general, the instructors giving those classes will provide candidates with all the information they need, as well as the necessary study guides. Candidates, however, will have to devote time to study outside class, the amount of which will depend on their level of knowledge and their learning skills.

Most instructors giving radio amateur classes will distribute copies of this document, as well as the Radiocommunication Information Circulars listed below. However, candidates may also obtain, in limited numbers, copies of these circulars from any district office.

RlC-1 - Guide for the Delegated Examiners

RIC-3 - Amateur Service

1. Countries that Forbid Amateur Radiocommunications
2. Countries with Which Agreements or Arrangements Have Been Concluded to Permit the Exchange of Third Party Traffic
3. Countries with Which Reciprocal Operating Privileges Have Been Arranged

RlC-25

1. Radio Regulations of the I.T.U.
2. Radiocommunication Act

3. General Radio Regulations, Part II, Affecting the Amateur Service

Dave;

You might have missed my earlier posting, but you and anyone else looking for a 10M HT can find the last of the AEA DX-Handy stock at Surplus Sales of Nebraska for $159 (originally $318 when I bought my first one). It's a fine rig, whose only drawback is that it's VXO'd, with provisions for only 2 crystals. Stock unit covers 28.250-28.300 on xtal "A" and 28.300-28.350 on "B". Surplus Sales tells me that they're out of most of the popular xtals, but JAN can supply xtals for the unit at much less than the original AEA price of $15 each.

Again, it's a really fun rig with a super reciever, good noise blanker and a whopping 2W out. Runs off either 6 AA cells, 7 AA nicads (not supplied) or external regulated 9.5v. Nicads can be charged in the unit, too. SSB and CW. Working from my back yard near Detroit, my first contact was San Diego.

Subject: KISS ROM set for Ashby TNC

Several years ago I purchased and used an Ashby TNC when packet radio was just starting up. In the environmental spirit of things, I'd like to recycle the unit and continue to use it with a more modern networking system (e.g., the KA9Q NOS package).

In one of the earlier versions of the KA9Q documentation, there was a reference to using (and I'm loosely quoting here) "... the HAPN/Ashby board..." which I presume both used the Intel 8273 for HDLC framing.

Does anyone have information on whether there was ever a KISS ROM set for the Ashby board, and if so, is there anywhere that I can get a clone of it, or the hex listing to blow into a PROM ?

I'd appreciate any info on the subject matter someone might know.
Responses can be either to the mailing list or to:

jhk@saturn.acc.com

Thanks very much.

There have been numerous comments lately about disputes with VEs. In particular, whether the VE should allow "writing down dits and dahs" for later translation for the test answers.

The more serious issue is lawsuit resulting from improper testing.

WHO AM TO HAVE AN OPINION, AND EXPRESS IT SO VERBOSELY?

I am an active member of the VE team with Texins Amateur Radio Club (Dallas, Texas). We're under the sponsorship of the W5YI-VEC. In regard to disputed testing methods, I feel it is my duty to KNOW what is legal and proper. If something comes up that I DON'T know, I'd better be finding out, and fast.

Our VE Team Leader (Contact VE) is Bill Warner, KB5F, and I trust his knowledge and leadership, but I would not be embarassed to contradict him if I could back it up. (However, I've found he's usually right--he does his homework!) We have about a dozen hams in our club who are VEs and they all pitch in.

Dallas is rich in ham population and ham clubs, and you can find a VE session almost any weekend. I realize other parts of the country are not so "blessed", and VE teams and ham clubs are few and far between.

MY OPINION (AS A VE TEAM MEMBER) ON WRITING DOWN DITS AND DAHS

This has not been an issue in our testing, and I've never seen anyone try it. I am not prepared at this writing to voice an opinion on whether it should be allowed, having not fully researched it. However, I (IMHO) believe that it should preclude one of the two methods for grading, namely solid copy.

Remember that the ten question test is only one of two ways to pass the code element. We have had a number of applicants who have just missed the 70% but have had a solid minute of copy.

Although I would not encourage it among the code students I coach, I am not sure that I could preclude it in the exam. I would want to re-read the rules and make sure I understand the wording, and ask some other VEs for their interpretations.

PART 97 AND VEC GUIDELINES

The VEC prints and distributes the rules and procedures for examinations.

As good a job as the VECs (or the FCC, even) might do on writing rules or guidelines, there is always the possibility for missing some situation. This is where a VE team must make a decision. An informed decision is necessary, within the given guidelines of the program.

If something that is NOT covered in the guidelines comes up, the VEs will use their best judgement, but the responsibility doesn't stop there. In some cases, the right answer is to take NO action, until better information is available.

An arbitrary ruling, subject to widespread and emotional dispute, could conceivably have repercussions and be damaging to the entire VE program.

Although the VE team members are knowledgable, the DO NOT MAKE POLICY. Any "rule" I state, I must "back up" with either the FCC Part 97 or the Sponsoring VEC's guidelines.

HANDLING PROBLEMS

Because I feel that part of the "mission" of the VE program is to HELP the applicant get as much of a license as he/she can legitimately qualify for, if there is a question that could not be resolved at that time I (personally) would make all reasonable attempts to

* find a definitive answer in a timely manner,

  We have Part 97 and the W5YI-VEC guidelines on the test site for just that reason.

  We also have W5YI's phone number, if it needs to go that far. Fred Maia does a phenomenally big job in supporting lots of VE teams. If a dispute looked as though it might become a significant one, I would want him involved as early as possible.

* provide alternative testing for the applicant whose test could not be completed.

  If the issue could not be resolved "on the spot" to everyone's agreement, then at least we need to "agree to disagree" and plan for resolution.

  Just because the VE Team has Monthly Exam Sessions, we are not limited to them. Special exam sessions can be held at any time for any reason. They must be made open to the public, and reasonably advertised, but nothing in the VEC rules precludes additional sessions.

RESOLUTION OF QUESTIONS OR DISPUTES

One reason THREE Volunteer Examiners are required is to help "fill in the gaps" due to relative inexperience or indecision. Also, two examiners can be deadlocked, three, less likely.

* In the event of dispute in interpretation of the rules or grading, I would first check the documentation on hand.

  For example, what's the EXACT wording about the code exam? The phrase "copy by hand" does not do it alone. "In English" may not do it alone. You MSUT NOT quote the rules out of context.

* I could also ask other VE teams.

  Maybe they've had the problem come up already. What did they do? Did they find a written ruling? Did they ask the FCC? Is it resolved?

* If we cannot resolve the problem that way, the next resource is the VEC.

  Whether it's the ARRL, DeVry, SoCal, W5YI, or any of the other VECs around the country, I would first ask my own VEC, but would not be shy about contacting one of the others for a "second opinion," especially on issues that might be controversial.

BY THE WAY, YOU ARE NOT EXCLUDED FROM FINDING OUT

A test applicant should not be shy about contacting, first, some other hams, then, a different VE team.

If an applicant felt, sincerely, that examinations were being improperly conducted, he/she should proceed. The VECs publish their phone numbers and addresses. They are also often represented at larger hamfests.

WHAT IF I DON'T LIKE THE ANSWER?

I personally do not believe that the final resolution is that the "dit-dah" approach must not be used.

Would that mean you must also preclude someone from taking SHORTHAND?

Personally I would not, but I could not grade it for solid copy. (I don't speak shorthand!) Should a similar approach be taken to an applicant writing down the dits and dahs?

> (My writer's electronic companion complains about the frequency of the word "personally" here. I want to make it clear this part is my own opinion and does not represent the FCC rules or VEC guidelines. Personally, I think this software is too picky.)

If the overall opinion (all the VEs and VECs and FCC and so forth) think so, then that's the rule of the game. But rules were made to be (no, not broken) changed. If you feel strongly enough about it.

And if you feel strongly about it, you can champion the cause, spend a lot of time and effort to engage the agreement of other hams and VEs and VECs and you still may not get your way.

Or, as someone suggested, you can go to court. There, you ask someone who knows little or nothing about amateur radio make rules that affect amateur radio.

IS LAWSUIT THE ANSWER?

I certainly hope not. If any applicant anywhere ever brings a VE into court, and the case is NOT thrown out for being frivolous, I will turn in my VE card and never sign another CSCE or the back of another 610.

It's not worth the risk. If you are volunteering to do a service, and you do a reasonable job of being aware and competent, and are doing it because you care about the hobby (that very word is significant) and still some wiseguy can haul you in because he didn't like the way you do things, that takes all the fun out of it.

I think if it ever happens, I will be saved the trouble, however, because the FCC will simply hold up a hand and say, "that's all!"

The VE program is (IMHO) a Good Thing, but it is precariously balanced on our Good Behavior. The FCC doesn't have the time or budget to be bothered. I would not blame them.

FOR WHAT IT'S WORTH

Rarely do I get on the soapbox quite this much, but I do believe in the VE program, and all this stuff I've said above.

That's my opinion, for what it's worth. If you are still here, and haven't hit "delete" yet, you probably have an opinion of your own, and if you don't feel like posting it, E-mail it to me directly. I am interested in what you think, it's why I read this newsgroup in the first place.

If I've stepped on any toes, I'm sorry, nothing personal, I'm just saying what I think, and am now braced for any flames, jabs, jibes, or whatever.

Actually, I hope you DO have an opinion, and are willing to express it.

As far as I'm concerned, that's what makes ham radio fun.

Have a nice day.

Yes, there's every reason to feel good about the hobby/service when something like this happens. However, there is no need to try and justify the feeling by knocking other people's passtimes. All the different sub-hobbies in ham radio have a right to exist and be valued for what they are. Not everyone has to do the same thing, and, in fact, it would be a pretty bad thing if they did.

It's possible to promote the good parts of radio simply on the basis of thier goodness. There's no need to put down other parts of radio.

A frequency counter and/or an RF Field strength meter wouldn't do a car thief any good. As mentioned in previous articles, LoJack ISN'T activated UNTIL the owner of the car finds his/her car stolen. Often, this can be several hours.

Since the system isn't activated, it wouldn't be sending out ANY RF (not from LoJack anyway....)

I too am curious to know how the LoJack transmitters are activated.
I know the 173.075 Mhz freq is the "beacon" frequency. I am wondering if they use the same freq. for activations.

I guess I missed the part where we decided that North America was the Universe.
Regardless of what part of the planet the shuttle is over, it will not be taking
calls from J. Random Ham. Neither is there a moral or leagal obligation for
them to work hams when they are in range of North America. As Patty Winter
points out, there is no reason they can't; they're just not scheduled for it.
All the voice contacts we know about will be by sked, and that is not
brain-dead, it's just their choice.

|>
|>Why wasn't that schedule ever posted here? All of the AMSAT bulletins I've

I seem to recall reading it here, though it may have been elsewhere. I don't quite understant the tone of "Why wasn't it posted here?" like there is again some moral or legal reason why it has to go out on the usenet.

|>>On the other hand, there's always the packet robot for those of us without a

Gee, really? You mean I can only connect to the robot when it's operating? Thanks for the tip. Since, as you point out, they won't be doing voice over North America, it probably won't be a problem. Also, and you couldn't know this, since I don't leave my packet gear bleating over the air without my being in attendance and knowing that there's a chance of making a connection, again there should be no problem. But thanks for your concern.

In article <4143@altos86.Altos.COM> jerry@altos86.UUCP (Jerry Gardner) writes:
>
>I'd recommend getting the 32S-1/75S-3 combination. The newer models have
>a few additional features, but they're not worth the almost double price.
>(I've been told the S-line is very popular in Japan and the Japanese
>hams have driven the prices way up).

>
For serious CW work, avoid the 32S1 like the plague!!! It used the sidetone to key the transmitter, and does <not> have a good cw note. The 32S3 is a far better rig for CW work (as well as being several years newer).

The receivers are all good. Some folks think the 75S1 is actually a bit better on 80 meters than the newer receivers, but it's not as hot on the higher bands.

Another minor correction to Jerry's comment: the 75S3B is a later model than the plain S3; I believe it adds the second CW filter position and there are some circuit improvements. The '3C is identical to the B but has the second crystal deck.

The "round emblem" S-lines are later than the "winged-emblem" ones, and are priced a bit higher. The round emblem 75S3B/C (and a very few of the last winged emblem ones) has an additional rf transformer and a shield around the mechanical filters; these two features do improve the receiver performance somewhat. The late model rigs with "MCN" number stamped on the back are the most valuable of all; not any better, but the MCN numbers were used only on the later production runs, so seeing the number means it's a late-model set.

When I had S-Line equipment, I swapped around for a while and ended up with a winged 32S3, round 75S3B, and a 75S1 as a second receiver. It was a great setup.

Well, I don't exactly live and breath amateur radio. The main reason that I am an ARRL member is to get QST, and to keep up on new regs from the FCC. I don't work HF - mostly 2M with my wife. (I also read the net regularly and subscribe to too many magazines).

There are some things that I am concerned about. One of the main ones is restrictive covenents against radio antennas in housing developed during the last 10-20 years - an issue that is preventing many people from considering amateur radio as a hobby who otherwise have the resources to consider it. Since I am not even close to retirement age, this is a problem that may be unique to my age group. Is the ARRL doing anything about it? Nope. But will they promote more contests that inspire some to expend large amount of money to go to barren islands so that others can interfere with each other and make the bands useless for other uses? Yep. Will they spend a large wad of cash for a shortwave broadcast station, then come to the membership with hat in hand looking for money for WARC-92 funding? You bet.

To the person who could hit 14 repeaters, yet couldn't access the patch:

SHAME on you for not finding out what repeaters have 911, and how to access it! It is easy to find out the 911 emergency codes for almost every repeater in the state of Hawaii. If you don't know exactly what it is, everyone has nearly standardized on one of the following:
911, *911, or *9.

It wasn't anyone else's fault for not sitting around waiting for you to have an emergency... it was YOURS for not getting the information ahead of time. What do you use 2 meters for? Haven't you talked on any repeaters at all? Most clubs publish these codes in their newsletters. Are you in any clubs?

Sounds like you don't use 2 meters much. If you don't put out any effort to be prepared, don't blame the rest of us when you aren't prepared.

MONDAY OCTOBER 8, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* MIR NEWS *

============

A new and exciting amateur radio project is being planned for the Mir space station known as the "Amateur Radio Experiment on Mir" or AREM. This project is the result of a collaboration between hams in the Soviet Union and the Austrian Amateur Radio Society (OeVSV). This project is designed to provide equipment for both 2M packet data and voice transmissions from Mir. The voice messages from Mir will provide timely information to radio amateurs while being another educational tool to help school teachers start students thinking about space science. The voice messages will be spoken in German, Russian, and English. The voice beacons will alternate with packet transmissions.

The basic AREM station will consist of a 2M tranceiver, a lap-top computer, a TNC-2 running at 1200 baud and using AX.25 protocol, and a voice sythesizer. A special external 2M antenna will be attached to the outside of the Mir space station for this project. The first AREM operations are expected to begin around January 1991 when an Austrian cosmonaut will install the station after he joins the crew of the Mir. After the Austrian cosmonaut finishes his mission on Mir, the equipment will remain aboard the space station. It is envisioned that an upgrade to this station will be to incorporate Bulletin Board System (BBS) software on the lap-top computer. This upgrade is not envisioned to happen until November '91. Also, it must be emphasized that if the cosmonauts wish, at any time they can pick up the microphone and call CQ. To obtain further information about AREM, please write to:

Wolf Hoeller (OE7FTJ)
Amraserstrasse 19
A-6020 Innsbruck
Austria

[Information via ANS and OE3ACC]

* BADR-1 NEWS *

The University of Surrey would like to receive reports from anyone who is receiving BADR-1 on either 145.825 or 144.010 MHz. Brief reception reports should be sent to:

University of Surrey
UoSAT Spacecraft Research Unit
Department of Electronic Engineering
Guildford, Surrey GU2 5XH
England

* OSCAR-10 NEWS *

Until further notice please DO NOT use AO-10's transponder!

* OSCAR-11 NEWS *

Suggestions on the most useful operating schedule for UoSAT-2 should be sent to UoSAT as soon as possible so that they can be taken into account during an operations review due to take place later this month.

* OSCAR-13 NEWS *

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

* FO-20 NEWS *

FO-20 is continuing to experience high temperature problems (due to the spacecraft experiencing no eclipse periods during which it can cool down) which is forcing a drastic reduction of operations. As of the weekend of 29 Sept 90, the battery temperature had risen to near 45 degrees C. Extended exposure to high battery temperature will decrease the useful life of the battery.

From		To		Mode
011090	0900	021090	0910	PSK Telemetry acquisition
041090	0955	041090	2330	JA
081090	0920	081090	1110	JA and JD
111090	0825	121090	0850	JD

The above dates and time are in UTC and the schedule may change without notice. The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

>>I am highly musical in many different instruments and voice, and I'm STILL
>>trying to reach 13WMP.......

>>I just can't do it!

You could try my method if you want, it worked.

Use a computer. Get (or write) a program which will generate random code groups at a specified speed. Warm up with a speed you can do easily (even if it is only 4 or 5 wpm). If you can copy with only 1 or 2 errors in say 100 characters, increase the speed by 1 wpm. You will get to a speed where you are consistantly making more errors, and work there for a while until you can increase. If you get totally flattened by a speed, just go back one. Continue this until you break your pencil in half (at least 30 min.) repeat at least twice a day. You will break through the 10-11 wpm barrier using this technique.

I managed to get my speed reliably up to about 18 and then got lucky on my test. But I could never do it now.

I agree with what Jay is saying and heartily respect his opinion, especially
considering that he is an EMT. However, I guess I should have mentioned
in my original post, that the guy that stopped is a volunteer fireman,
and is also involved with the Camden County emergency rescue squad. I'm
not exactly of what training he has, but I do know he has the background.
I wish I could remember his call - N3GX? - in any event, he did the
right thing in the situation, fortunately for all involved.

I stand corrected.  That's what happens when you get second-hand info.
Apparently the trigger frequency is in the 900 MHz band, but the
continous beacon is on VHF.  Does anybody know the format for the
beacon?  Is it a continous signal, does it have any sort of a vehicle
ID transmitted, etc?  It would be fun to leave the scanner on this
frequency to listen for activity.

```

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I hate to be a pedant about this, but have had to "discuss" this with inspectors in the past. RG-8 Coax, regular yellow jacket Ethernet cable and regular phone wire are all flammable. They are also OK inside walls, under carpets, across closets, through roofs, down conduit and suspended in false ceilings.

If the cable is going to travel inside any air duct, it needs to be plenum rated. This includes any false ceiling used as an "air return". An air return is when the air returning to the egg-nishning unit goes via the false ceiling cavity rather than via special ducting. Now if a building is being "remodeled" or suffering "tennant improvements", all new cable in plenums must be plenum rated. If there is tons of old 25 pair telco cable abandoned in the plenum that is not plenum rated, it is grandfathered and no one complains. But that 25 foot run of phone wire you just slipped in better be plenum rated.

Plenum wire is more expensive than regular and harder to work with. The plenum rated Ethernet is teflon. See an earlier posting of mine in this thread for specs of Belden plenum Ethernet.

Thank you for your attention. We now return you to our regular programme: Code Wars

Bill--

I worded that carefully. I said the schools' "transmissions" will be relayed via phone line to the ground stations in other countries. The schools *will* be transmitting on 2 meters (or whatever repeater band they wish). The repeater they're using will be autopatched to the Telebridge, but anyone listening to the repeater will hear both sides of the conversation *on amateur radio*.

One school wanted to have the kids speak into a telephone connected to the Telebridge because they didn't have a repeater with autopatch nearby. The League said, "No way."

I agree that it's a bit of a compromise, but only one part of the linkup is via phone lines. It was either that, or only work schools in the lower part of the U.S. This system seems acceptable to me under the circumstances.

Perhaps someone from AMSAT (which is handling the linking system) would like to say more about this.

1) CALM DOWN! We don't need another flame-fest.

2) Most repeater groups in Western Pennsylvania make their lists of emergency access codes available only to dues-paying members. Based upon my travels, this seems to be true elsewhere.

3) What is needed is a nationwide standard repeater code for accessing emergency services. Repeaters adhearing to this standard would be highlighted in the Repeater Directory. Any visitors to an area needing assistance would simply look up the nearest repeater with the standard code and call for help.

>will be in session in North America, and most of those kids will be fast
>asleep.

Ron will be asleep then, too.

The school QSOs are *not* scheduled for times when the shuttle is passing near the United States. They are scheduled for times when Ron is not busy doing what he's being paid to do: help run the Astro 1 experiment. We are just damned lucky that he's on the "daytime" team and not the other one. (Or perhaps NASA, which has been very supportive of SAREX, put him on the day shift intentionally.)

Once they figured out when Ron could squeeze in some QSO time, then the problem became, "Okay, how do we make it possible for Ron to talk to kids in the U.S. at those times?" The solution was using ground ham stations in South America and Australia to relay.

(Don't get confused by the fact that they're in the southern hemisphere; if they were too far south, they couldn't hear the shuttle any better than people too far north could. It just worked out that during his free time, he'll be going over those areas.)

>Why wasn't that schedule ever posted here? All of the AMSAT bulletins I've

>operation from private stations. If there are some reserved slots, it would
>be the proverbial Good Thing to publicise them.

Someone did post a detailed SAREX schedule here a couple of months ago. The two-way QSOs were listed as "DEMOS", which was explained at the time.

>>On the other hand, there's always the packet robot for those of us without a
>>sked.

>
>Such packets might be music to your ears and mine, but not to the schoolkids
>you'll be QRMing, as the robot and Ron are operating on the same frequency
>(albeit not the same time). Check out the MET schedule, and then listen
>before hammering at the TNC.

Paul, if you mean that people will be trying to access the robot during
the times reserved for two-way skeds, I guess that could happen. But
remember that the schools will not be transmitting on any of the
shuttle ham frequencies. They'll be using whatever freq. their local
repeater is on. Ron's half of the conversation will be coming out
through the repeater as well. And of course, all this will be rebroadcast
on WA3NAN and other NASA ham stations so that the rest of us can listen in.

>What we have here is....failure....to communicate. With all of the STS35
>launch attempts, some of the details have obviously slipped through the

It seems to me that it would do a great deal of good.

If I were a car thief *and* was driving a car that I had just stolen *and* had a scanner/counter/fsm *and* the scanner suddenly indicated a strong signal then I'd know that every cop in town would start looking for the car that I would be in. I'd park it, wipe off any fingerprints and take a bus out of the area pronto.

Greetings. Good news. It took a bunch of phone calls to pin this down, but it *appears* (for the moment) that the proposed 10% electronics tax did not make it into the final draft of the budget agreement that is currently under consideration. As late as Monday afternoon, personnel at our U.S. Senator's office believed the tax *was* in there, and that it *would* affect computer and telecommunications equipment, as well as consumer electronics. Other sources gave the price level at which the electronics tax would kick in as either $100 or $1000, depending on who you talked to. Meanwhile, on Monday morning, the Wall Street Journal published an article saying the electronics component of the tax was *not* in the final agreement. So there was considerable conflicting information.

Much of the confusion apparently revolves around the many drafts of the agreement and the incredible flurry of activity involving consideration of the budget.

In any case, according to a phone conversation I just had (Tuesday, around noon, PDT) with a Wall Street Journal writer who was by far the best versed on this topic of anyone I had reached anywhere, the 10% tax on electronics equipment is indeed *not* in the present agreement. According to current info, the 10% tax *would* apply to:

Furs over $5K (except leather and artificial fur)
Jewelry (including watches) over $5K
Private boats and yachts over $100K
Autos over $30K

This is all to take effect this coming Jan 1 if the budget agreement passes.

The electronics tax was indeed in the agreement originally, but was dropped from the final draft, apparently.

It is important to note, however, that this is all subject to sudden change. The electronic equipment tax could reappear at any time in the negotiations, either now or later. So it would be a very good idea to keep as close a track of the developments as possible, because if changes occur we probably will have VERY little time to react and let our opinions be known. And of course, there are many other aspects of the budget agreement, in terms of other taxes, fees, program cutbacks, etc., that are also very important, and about which our representatives would appreciate our input, I'm sure. Apparently they haven't been getting very many calls about the budget, and they really are interested in hearing voters' opinions when you call.

Given how difficult it is to obtain basic information about something as important as the budget, the more people in the technical community keeping abreast of what's going on, from different angles, the better!

>You can avoid overloading your HT with out of band signals by putting a cavity in the line to your outside antenna (highly recomended), or you can buy an HT that doesn't have wide receive coverage such as the IC2 from Icom, or you can buy a base rig for use with outside antennas.

Gary

I am having this problem with an FT207 and am wondering what a cavity is, where to get one, and how much they cost. Since I only paid $115 for the ht, I hope it won't be much.

You were right on about NOAA, I wasn't hearing it at all, with my rubbery ducky or even with my broadband radial at 7 feet, but when I put it up 24 ft, it came in loud and clear.

Thanks

mike edelman ke8yy writes:

>I got a big laugh from Phil's note about the aircraft with ZANTOP on it- particularly his friend's recognition of it as a Russian craft.

>Many years ago I worked at Detroit Wayne County Metropolitan Airport, DTW to all you air travellers. Next to my building was, you guessed it, the home of Zantop Airways. They're a small airline that at the time ran a few cargo DC-3s and a few Lear Jets. They were notable then for having crashed *2* Lears into gas tanks near the airport, and for the fact that the owner's son was the youngest licensed jet pilot in the country.

ZANTOP used to have a hangar at Indianapolis Int'l Airport. A guy who worked elsewhere at the airport told me they hauled freight, especially automobile parts for car assembly plants. He was rather uncomplimentary, saying that their planes were ancient and in poor mechanical condition. I later heard that they got in trouble with FAA for maintenance violations.

Indianapolis Air Route Traffic Control Center, also located at the airport, has an _enormous_ HF log-periodic beam on an extensible tower. Wonder what it's for? I know that overseas ATC uses HF SSB, but I think Indianapolis Center handles handles only domestic traffic.

Greetings,

Last night I went to a committee meeting of the North-West Packet User Group (NWPUG) and it came apparent that we are having routing problems in the UK in that Packet mail is not always reaching its destination outside the UK.

We are trying to track down the problem, and were wondering if all the people on these two lists were to send one short message to me on packet plus a copy to me here at work (so that we know how many messages to expect), it would help us to plan the forwarding a bit better.

John

Some of the close range stuff like the remote "find your car" stuff I've been told operates in selected channels in the 30-50 MHz abnd, or so I've been told.

The 'pager' type systems usually operate in CB band, on the class D channels, where there is NOT supposed to be any traffic like voice. These are the channels between 3-4, 7-8, 11-12, 15-16, and 19-20. There used to be 2 more between 22 and 23, but these are now CB channels 24 and 25. The D channel between 15-16 is usually bootlegs by SSB operators, and the channel 19-20 is usually torn up by trash and splatter from 19. The channel from 7-8 is also usually torn up by *$$h@L&s trying to run skip. For some reasing there is a whole class of idiots, beyond your worst CB nightmare, that hang there and on CB channels 6-8. The other class D channels are relatively clean, but relative is a touchy term.

I think class D used to be restricted to 100mw, but now has a 1W limit. Be careful with these setups, as they use the regular car antenna. They usually work well, but if you have a retractable......

The other danger is a lot of cars have CB/AM/FM antennas. These devices are designed to plug into the AM/FM antenna, and pass AM/FM through to your radio, with circuts to block and protect the radio from the 27-50MHz signal. With multi-band car antennas there are filters and/or splitters at the base of the antenna also designed to do the same thing. If these devices are hooked up to the AM/FM cable, and there is a blocking device at the antenna, then the pager sees a high impedance load it can't handle. Besides being bad for the pager, sometimes the circuits designed into the pager to 'protect' the AM/FM feed from the signal can't handle the voltages now present, and the 1W transmitted siganl now gets into the AM/FM radio at levels high enough to burn out the first stage. CHECK YOUR SETUP!!

In my case, I had an AM/FM/CB antenna on my one car, and I took the AM/FM feed to the radio, and the CB feed to the pager, then tuned the pager for maximum output into a field strength meter.

I'm fairly new to this newsgroup and to its contents. However, I'm not exactly new to amatuer radio. My father has been acitive on 2 meters for as long as I can remember and the bug is catching. Bascially, I'm looking for personel insight on getting started, such as learning code, basic technical knowledge that is good to know and so forth. Hopefully I can pick up lots of general knowledge along the way as well as get some feedback. All responses are welcome.

Brian K. Sutton
I don't think a disclaimer is really necessary.

Someone asked about Ethernet coax, so, from my files:
(from 1 1/2 yrs ago:)

I found out from an engineer at Belden some attenuation values:

	Freq(mhz)	attenuation(dB) per 100 feet
Ethernet (#9880)	1	0.19
	5	0.37
	10	0.52
	50	1.2
	100	1.7
	200	2.5
	400	5.0
RG8U (#9914)	50	1.2
	100	1.6
	200	2.4
	400	3.5

As you can see from the above table, Ethernet coax is similar to RG8U coax to 200 Mhz. It's a little worse than RG8U for 400 Mhz. But it should be just fine for 2M and 220 bands. They test up to about 10000 Mhz and there's no sudden deviations from a smooth frequency vs attenuation curve. And they say that Ethernet coax should be able to handle about as much power as RG8U. The foam stuff, mind you.

> When you acquire used coax (not surplus brand new coax), you have to be aware that it could have something bad about it. Look for holes in the braid (where taps may have been), water damage, and anything else that could make any coax bad. Of course, the best coax to get is coax that is new and never used, and never exposed to water or weather.

Ethernet coax should work fine for most amateur applications up to 220, assuming that it is in good condition. Don't know how well it stands up to being outside, as compared to RG8U, but the teflon coated stuff should be fine. In all likelihood, the yellow pvc stuff is just like the black pvc insulated (coated) stuff. I saw one person post that he used the yellow stuff outside for 5 years with no noticeable degradation. I used Ethernet to drive my 2 meter antenna dedicated to packet (so, it still is in a digital mode! :-)). One last thing, the shield is excellent.

I suppose you could use regular RG8U in computer installations, except that the center conductor of RG8U is stranded, not solid like Ethernet. Vampire taps might not bite into it so well. Also, building inspectors will complain that RG8U could burn.

For those interested in a plausible conjecture, take a look at page 47 of the October, 1990 issue of Worldradio magazine. If they are right, it is the congress-critters who first started to use this term to address radio amateurs back in 1911.

Is there any PC software available (perhaps even by ftp) that will receive weather maps at the full resolution of which the PK232 is capable? PKFAX, from AEA, uses the mode which drops 2/3 of the lines. I would like to grab all of them and run at the maximum usable horizontal pel rate as well. I would then view or print parts of the total image.

Please respond to McHarry@MITRE.org. I will summarize any replies here. Thanks.

>Club at my school (Northeastern University, Boston, Mass.)

The slots for two-way contacts with Ron Parise were filled long ago, but anyone who likes can listen to his transmissions on 2 meters. Since you're 'way far north, that might be a problem, as the inclination of this mission's orbit will put it out of range for much of the U.S. You might be able to get in on the listen-only patches from the southern hemisphere stations to the Telebridge system. I don't know whether the ARRL is accepting more applications for this, but you could call them and ask.

>3) Does anyone know HOW radio amateurs became known as 'Hams'? Is there
>a rational reason for the term?

The ARRL researched all the theories (acronym for four hams' last names, etc.) years ago and determined that the most likely explanation was that the term derived from "ham-fisted", which was applied to poor operators in the old days of telegraphy. I think the word has become less pejorative since. Maybe. :-)

                   DAK MR101 RECEIVER

 I just received my new MR101 receiver from DAK and am very
 disappointed with its performance.  I intend to return it
 but don't know if I should have them send a replacement or

 faintly hearable on the built in antenna.

 The performance on SW2 (9.5 - 21 MHZ) is excellent as is FM
 and MW reception.

 This radio is packed with slick digital glitz but really
 sucks as a receiver.  However, at $49 it is probably too
 much to ask for.

 I took a walk over to Radio Schack today and found that they
 have the same radio with some minor v

Maybe if they were AFSK on FM or true FSK played back through an SSB
transmitter, sure it could be done easily. But my guess is that
it's neither. Any definate answers on the format/modulation and/or
frequency? Is it digital or analog? Is there any sort of a standard?

BTW, what's stopping car thiefs who are aware of Lo-Jack from buying
a $200 frequency counter from checking for 900 MHz signals? Seems
simple enough to me.

It's also worth noting that one of the main reasons that we hams use SSB
instead of DSB on HF was LeMay's work with Art Collins back when he (LeMay)
was looking for reliable comm for his aircraft...quite an interesting story.

(That ought to prompt some comments from the OT's :-) !)

Then there's my favorite LeMay anecdote...about the time they sent all of
SAC on a bomb run against Dayton...and *missed*!

This is very true. However, it is possible to calibrate the s-meter so
that its reading accurately reflects the signal strength at the antenna
terminal of the receiver. As with any other measuring instrument, you

must maintain its calibration or it becomes just a relative device again.
Most of us don't have the means to do the calibration, and most of really
don't care. Signal reports are, for the most part, subjective anyway and
sometimes vary depending on whether you give yours first, or the other
station does.

>In the meantime, I will have stopped and if noones on 2m or around me, I'll
>already have contacted the police my own way. 'Nuff said.

Not quite. You can just call your nearest repeater (isn't that why you have your rig?) and either dil 911 directly or have someone do it. That way, you won't have to explain your call. If you make an unauthorized call, you will spend a lot of time explaining to the dispatcher, or whomever, who you are, and why you're calling them directly. If it's precious seconds you're trying to save, you surely won't do it this way. And if it's *my* life you're trying to save please don't use this means. By the time you get through the hassle I'll probably have been carried to the hospital by a real Ham.

Greetings. Has anyone done some measuring of the charge currents for the BC-72A to determine how well the charger handles different situations? Some primary concerns are:

1) Charging of partially charged batteries. The sparse instructions say the unit will detect a full charge, but then goes on to say you shouldn't charge a full battery and that the unit will stop fast charging of a full battery after 5 minutes. In the general case, will the unit properly handle the fast charging of a partially charged battery without overcharging? Let's ignore "memory effects" for now...

2) After the unit stops fast charging, it goes to trickle charge. What is the current rate for trickle charge? Is it the same as for the "slow" chargers that come with the various radios, or slower still? The main issue is how long can you leave the battery on the charger in trickle mode after fast charging has ended without damaging the batteries? Overnight? All day and night?

3) Is it correct to assume that with all these Icom SAT, etc. radios, the radios' internal nicad batteries (when present) are never charged if you charge with the fast charger when an external battery

pack is in place? I assume that this is the purpose of the BA-12 adapter--to provide a way to charge the internal batteries with the fast charger?

And finally:

4) Does the internal lithium rechargeable battery, used for memory backup, etc., stay charged from the external/internal nicads? That is, if you always charge the external batteries separate from the radio, and never plug the radio itself into the wall chargers, will the lithium battery stay at full charge (presumably deriving charge from whichever external nicad is attached to the unit)? Or is occasional "wall charging" through the radio jack itself required to keep the lithium rechargeable up to snuff?

Rechargeable batteries have to represent one of the most misunderstood aspects of modern equipment. Thanks much.

I recently "upgraded" to an S-line station as well and did quite a bit of investigation in the process.

I ended up getting the 75S-3 receiver. It covers 3.4-30 MHz in 200 KHz segments. It came from the factory with crystals covering all of 80, 40, 20, and 15 meters; 28.5-28.7 MHz; and 14.8-15.0 MHz (WWV). The 75S-3B is identical except it has a second crystal board built-in that is switchable from the front panel. This allows you to add crystals for more frequencies. All models let you increase coverage on 10 meters and add coverage of the WARC bands.

The 75S-3C is almost twice the price of the -3, but probably isn't worth it.

There are three transmitters in the line: the 32S-1, the 32S-3, and the 32S-3A. The 32S-3 has all of the features of the 32S-1 and a spotting control. Likewise, the 32S-3A has all of the features of the 32S-3 with the addition of a second switchable crystal board.

All of the transmitters run 175 watts PEP input SSB and 160 watts input CW.

The S-line does have a few quirks common with older equipment. For example, the antenna connections on both the receivers and transmitters are RCA phone jacks.

I'd recommend getting the 32S-1/75S-3 combination. The newer models have a few additional features, but they're not worth the almost double price. (I've been told the S-line is very popular in Japan and the Japanese hams have driven the prices way up).

I got my S-line from Associated Radio in Kansas. They specialize in reconditioning Collins equipment and generally offer top-of-the-line product.

I used to have a very high opinion of Canada, and the Canadian people, when I lived in Windsor, Ontario, for 4 years. I thought that their government, although different from the government of the United States, was pretty reasonable (being fairly representative of the will of the people). I didn't like how socialistic Canada was, but at least they didn't have a Draconian government like some of the former governments of the Eastern Block countries.

The latest report from VE6BBM makes me think that perhaps Canadians are loosing rights faster than we are in the states. Seriously, prohibitions against owning certain equipment, because you aren't licensed to connect it up to an antenna and radiate? Requirements to notify both the local and the federal gov't each time an antenna installation is modified? No more reciprocal operating agreement with the United States?

While Europe is busy unifying, and preparing to become the largest economic power in the world, and getting rid of the old regimes (in Eastern Europe), both Canada and the United States are busy taking rights away from their citizens. (Some examples from the states include gun control/restrictions, defacto suspension of the first ammendment both for free speech and free practice of religion, defacto suspension of the right against unreasonable searches and seizures, and taxation without representation. I'll be happy to cite examples of all of these if challenged.)

Has this not been true already? I have noticed phone operation in the lower part of 40 meters. I thought I even remembered a VE operator (in this newsgroup) who said he stayed there to avoid talking to US operators. What did the subbands used to be?

>4) ***** US amateurs will now require an operating permit from the DOC
>   ***** before they can operate in Canada!

I am very disappointed in this one. It was a real thrill to bring my 2 meter rig at the last moment on a trip across Ontario (from Niagra Falls to Windsor). It allowed me to really get a taste of the local flavor and left me with a very positive impression of the local ham community there.

I assume that the US, in its typical wisdom, will stick to the present scheme and not reciprocate. [Is it still true the US citizens cannot buy property in Canada, while the US gets sold off to Canadians, et. al.?]

>7) I'm not 100% certain about this one, but I believe there is also
>   a restriction that says you cannot posess(!) any equipment capable

This could really keep you hopping as the WARCs bands change!

I got a big laugh from Phil's note about the aircraft with ZANTOP on it- particularly his friend's recognition of it as a Russian craft.

Many years ago I worked at Detroit Wayne County Metropolitan Airport, DTW to all you air travellers. Next to my building was, you guessed it, the home of Zantop Airways. They're a small airline that at the time ran a few cargo DC-3s and a few Lear Jets. They were notable then for having crashed *2* Lears into gas tanks near the airport, and for the fact that the owner's sone was the youngest licensed jet pilot in the country.

Another message mentioned that because of the fact that the shuttle is not going to be flying over the US anyway, the contact is going to be via phone to ham stations in other countries and then via radio to the shuttle.

Correct me if I'm wrong, but if the schools are going to be talking on the phone, what is going to make them think this has anything at all to do with Amateur Radio??

It looks to me like an advertising for MA Bell. "Gee mom, we had fun in school today. We called the space shuttle on the telephone."

The only ones who will know that this had anything at all to do with ham radio are the hams. I believe they call this preaching to the choir.

Just sign me disappointed. :-(:-(

|>

Yup, sked-only. Nope, not brain-dead. It has always been up to any given ham who they want to talk to and how they want to do it. In this case, Parise wants to talk to school kids and scheduled particular slots of time to do it in so they can know when they'll be able to talk. That's his right. Of course hams who don't like it can always QRM the transmissions to show kids what ham radio is all about...

On the other hand, there's always the packet robot for those of us without a sked.

I've used both the ARR preamps and the Landwehr. I think the ARR preamps
are a wee bit more sensitive and cheaper. They don't last too long at my
location though. Lightning got one for sure (can you say charcoal) and the
gasfet in two others died for no known reason. I'm currently trying another
Landwehr.

|>
|>So you're going to SUE him?   [...]

The guy's a volunteer. OK, they get one "attaboy" for that. The guy decides the job he volunteered for is one he doesn't like, so he changes the job. There goes the attaboy. The guy prevents a person from obtaining a legally-deserved license on the basis of personal whim. Yes, he can be sued. Also if the nice guy who volunteers to be a school crossing gaurd decides to frisk you, he can be sued. If the hospital volunteer decides to throw the medication in the trash rather then walk it down to the patients room, they can be sued. It's not only legal, it's proper.

We want volunteers, not vigilantes. If you volunteer to do a job and do it, you are deserving of the highest possible praise. If you volunteer to do a job and then betray those who trusted you by forcing your personal adgenda on the public, you deserve to be sued, flogged, dipped in hog vomit, fried to a crispy crunch and hung up as a warning to others who would subvert the volunteer's good work.

CEO summary:
I'm the proud owner of a semi-functional Cushman CE-4B service monitor. The RF synthesizer seems not to be working. In order to fix it, I'm going to need a service manual with schematics. Anyone having one that they're willing to copy for me (or mail me so I can copy and return), please contact me at the phone number below. Of course, I'll reimburse all costs and, if you lend me a manual to copy, I'll treat it carefully and return it quickly.
Thanks!

With all the bad hype going around on this newsgroup and the S/N plummetting every day, I thought I'd mention this - I know it made me feel good about amateur radio...

About three weeks ago, we had a member join one of the repeaters that our club co-sponsors. Only a week after receiving his membership package, which included the autopatch codes, he was driving up the Northeast extension of the Pennsylvania turnpike in a 2m-equipped tractor trailer. About 30 miles from the repeater, he witnessed a rather wicked accident which resulted in one of the cars involved flipping over numerous times.

He stopped, and was able to pull one of the victims out of the car, but the other was still pinned inside, unconscious. He called the PA state police via the repeater's autopatch, and they responded within minutes, along with the paramedic units and fire department. They were able to get the second victim from the car; shortly afterwards, the car caught fire.

The next day, the ham who had called in the accident contacted the state police. They told him that the victim that he had first pulled from the car was recovering and doing well, but would have been in much worse shape if the paramedics hadn't come so soon. The second (trapped) victim was also recovering and the outlook was good, though she was still in the intensive care unit.

IMHO, this is what amateur radio is all about. It's not supposed to be a competitive sport to see who can work the most countries, get their Extra the quickest, or send CW the fastest. Public service, technical advancement, and international good will are what this hobby was founded on. Let's keep it that way. Now if we can just get that #$(%*@ from calling his friends on the autopatch from inside his own house, we'll be in good shape...

If you listen to the CW subbands much, you can readily tell who has
the rythm and who doesn't.  Some hams flail along at varying speeds,
and with varying spacings between characters and words; while others
rock along in a lilting cadence that is a joy to copy.  There's a lot
of 'in-betweens'.  Some people are just getting used to their keyers,
so must leave them out until they get the hang of it; and some 1x3 calls
are just trying to unlimber their rusty keys.  But I do believe that
at least the rhythm aptitude helps both sending and receiving.  One Ham
I knew years ago mentioned that when he listened to music he sort of
imagined dits and dahs and tried to derive characters and words from lthe
music.  It is, after all, about cadence and spacing.

Several years ago I heard someone on a local police channel who obviously wasn't comfortable with HT operation or police procedures. The dispatcher talked with him. It turned out that one of the cops that had responded to a residence had left his HT behind. The dispatcher asked, on the air, if any of the cops knew who might have left an HT behind. He was still on duty, it turned out, and got to go retrieve his radio. I wonder who got debriefed in this case ....

akcs.dunnbri@vpnet.chi.il.us (Brian Dunn) writes:
> Is it legal for a packet radio station to run 'online games'? If so, has
> anyone prepared any games for use with packet radio?

Yes (it is legal) ... games can and are played all the time on the air.... from Chess, to Adventure and ZORK... to traditional Amateur Radio games of 'chasing DX' (trying to talk to distant stations) and on the air 'contests' (trying to talk to more stations than your fellow hams).
>
> The ability to have up to 16 connections to the same machine at one time
> makes for some interesting possibilities...

Actually, some TNC's support up to 26 users (times two for dual port)

(Kantronix). Of course, these TNC's can be 'networked' together to gain 'almost' an unlimited number of users spread over a wide area (i.e.: PacketCluster).

>
> I'm reasonably close to finally getting a ham license, and the answer to

>
> Does anyone get a little nervous at the thought of packet games filling the
> frequencies???

No (no nervousness), this sounds just as useful to me as a 'contest' or other 'non-public-service' use of Amateur radio frequencies.

Brian (and the net), several of us a few years ago were bashing about this idea and thought that it would be GREAT fun.... There is no legal problem with it... the only reason that it has not been done yet is that none of us are 'game implementers'... If you are PLEASE develop a game and make it available... Of course, you don't need a Amateur license to develop software (even software for Amateur Radio :-)), but it is more fun to be able to join in on the fun with your license....

By the way... there are systems that already connect a multitude of users (many times over 100) to a common 'database'... the PacketCluster software does this. It is 'sort' of a game, if you think about it... One user 'alerts' the others of a rare station that is on the air on a certain frequency... then sits back and gets to see who works the rare station first. It is kind of comical to watch a pile-up develop from these packet spottings. A person can even detect them on the air, it is obvious when all of a sudden a whole group of stations from the same geographical region start calling almost at the same time (within seconds to minutes of one another).

Don't worry about 'filling the frequencies'... we would rather 'use-them' than 'lose-them'....

By the way, my DOSGATE system has several 'text based' games available for playing via packet radio (mostly INFOCOM adventure style games). They are mildly popular...

I love the idea of a multiplayer Amateur Radio game.

I have envisioned a game where the 'plot' can evolve as players come and go... A 'game' of this type could go on for months... instead of requireing each 'player' to maintain thier involvement over the whole 'life' of the games instance... This is very intersting to think about... (and I DON'T consider myself a game player... as a matter of fact, I don't usually play 'games').

 Sorry, I couldn't resist to add my 0.01 cents worth:

  I have the KANTRONIX KAM... I have been 'impressed' at it's ability to copy morse code. It does a farily good job, even when the sender has a sloppy fist. Granted it is not as good as the human ear/brain combination, but I have been surprized at how well it does.

  Also, the center frequency and bandwidth of the filters can be varied in 1 Hertz steps (width from about 100 Hz (or was it 70 Hz) wide, to over 2 KHz wide; center frequency also over a wide range). Its tuning indicator makes it very easy to tune in a signal even when the bandwidth is set to 200 Hz (or less).

For those who have the KAM, don't forget to place the front panel decoder switch in the 'AM' mode when trying to copy Morse code.

Of course the KAM does: CW (morse), BAUDOT, ASCII, AMTOR, NAVTEX, PACKET (both HF and VHF), WEFAX (wefax requires a computer with a graphics screen and additional software, sorry it wont display on a text only terminal).

(no, I don't work for Kantronix...)

> 3) Does anyone know HOW radio amateurs became known as 'Hams'? Is there
> a rational reason for the term?

According to Cable Network News in a Field Days report (June 1990), the term HAM RADIO OPERATOR came about because in about 1907 there was an article in the Home Amatuer Mechanic magazine which described how to build a radio reciever and transmitter. Those who built and used these radios where then call ham-radio operators.

Sure seems like it might be the correct reason. I have since wondered if the Home Amateur Mechanic magazine changed its name to Popular Mechanics?

In return, Paul, I'm not sure what you mean by "allocating all of his downlink time." :-)

Ron has scheduled a number of voice QSOs with schools (about 30 in all). The times of these runs were posted here before the last launch attempt and probably will be again later.

Anyone who is in range of the shuttle at the time is welcome to listen to his side of the QSO on 2 meters. If you want to hear both sides, you can listen to WA3NAN or one of the other NASA ham stations that will be broadcasting on HF.

Because the shuttle will be mostly outside the range of U.S. hams, some mechanism was needed to relay between the U.S. schools and the shuttle. AMSAT is setting up a link wherein the schools' transmissions will be relayed via telephone lines to ground stations (hams) in other countries who can contact the shuttle. And of course, Ron's transmissions will come back the reverse route.

The company providing the phone link is the same one that helps

with the Teleconference Radio Nets. They are kindly also providing
a number of listen-only slots for each bunch of QSOs (usually about
20 minutes worth).

About 800 schools applied to participate in the STS-35 mission. As
I said, about 30 or so were selected for two-ways; the others were
invited to take a listening slot. I don't know whether all of them
were given slots; it depends on how many ports the Telebridge folks
are donating. (They normally make their living from providing this
service for real money, so it's really nice of them to donate all
this time for SAREX.)

All this, of course, has nothing to do with the packet robot, which
hams will be able to access only with direct contacts. It also doesn't
rule out the possibility that Ron will take the mike for unplanned
voice QSOs. But the scheduled voice Qs are all with schools.

Bottom line: I don't know whether any listen-only dial-in ports
are still available. The League would know. Other than that, hams
can listen on 2m (if in range of the shuttle) or to the HF rebroadcasts.

A segment on 20/20 a few months back showed it in operation. The
car beacon is activated by a transmission from a base. (They may
use a paging frequency. ???). The beacon then transmits continously.
The police detective has a dash mounted box with a compass rose
of LEDs (looks like a doppler DF) and an alphanumeric readout
displaying the beacon ID. So monitoring the beacon frequency
can only tell you that the owner knows the car is stolen.

>sked-only operation? Who came up with this brain-dead idea?

1. No.

2. Yes.

3. For voice QSOs, yes, mostly. As I mentioned in my other posting,
Ron is free to make unscheduled voice Qs if he has the time and the

inclination. He's a big boy now and can make his own decisions.

4. The ham astronauts. Take it up with them. (Perhaps they felt that conveying the excitement of amateur radio directly to schoolchildren was a little more valuable than trying to work hordes of hams calling each other names on the receive frequency. But that's just my guess. :-))

Anyone out there have any background or interest in radio astronomy? I want to build a radio telescope near my house and would like to discuss aspects of this type of work with anyone who is interested. Primary frequency of interest is 21cm. (Non transmitting only)

Bill, we plan to have our repeater autopatch call the conference bridge,
and thereby provide the audio to anyone listening with a scanner or HT
or ....

I understand that only 3 or so schools will pose questions, the remainder will
just listen in. The schools on the list are shifted up for each mission, so
eventually all will be able to talk as well as listen.

By the time you get through the hassle I'll probably have been carried to the hospital by a real Ham.
>

First I would like to state that I don't modify my rigs for out of band transmit and have no intention of starting now.
But this statement is ridiculous too.
Example: I used to work in Rockville MD and live in Gettysburg, PA. As you might imagine, it's a memorable commute, especially at rush hour. Well, one evening right around dusk, I got rear-ended at the part of 270 where the road narrows down to 2 lanes from 3 lanes (up by Germantown.) I could hear probably 2 dozen repeaters and bring up 12-14 of them. I could NOT get anyone to talk to me. I could not use the auto-patch on any of them cause I didn't know the access codes. After sitting on the inside shoulder of the road and continuously jumping from repeater to repeater trying to find some one to call the police (a necessity as the other car was damaged to badly to drive) finally a traffic reporter for a Fredrick, MD radio station came by and called the police on his cellular phone. It was almost 3 hours and pitch black before the police got there. If I had relied strictly on ham radio, I would probably still be sitting there today.

I don't necesarily condone jumping on the police frequencies when ever there is a problem but to anyone who has driven 270 at rush hour, the potential for a serious accident should be obvious, cars traveling at 60-70 mph disabled vehicles off on the INSIDE of the highway, there is no shoulder, just a thin strip and then a concrete barrier. Luckily nothing else happened but I have learned my lesson. I no longer rely on ham radio as a practical means of communications in an emergency. If it happens again, I won;t even try the radio. I will just flag down some guy with a cellular phone.

>LOOK! What did I say? I'm positive you can read, but I'll restate it.
>It says
>"if noone's on 2m" and that of course includes an emergency autopatch,
>which believe

I admit that I did have a little problem with "noone's" until I figured that it must be an acronym for "no one is". But we are talking about a big IF here, aren't we?

>it or not doesn't exist on every repeater. The three I have used the
>most had 1) No
>autopatch, 2) dial 811, 3) dial 0*1, not exactly uniform here. Read

I, and probably a few others, get the impression here that you think you must have an emergency autopatch (or any autopatch for that matter) in order to report an emergency on a repeater. While there may be a very isolated instance, such as cited by Bill Gunshannon, in which repeater users would not answer a life-threatening emergency call, I believe that you can reasonable expect repeater users/monitors to respond quickly to such a call and place the 911 call for you. Maybe it's different out west here, but I have never, never had a problem getting someone to make a phone call for me, or set up a patch-- just for the asking-- for much less important reasons.

>what I say and
>then yell at me for it. Oh, and BTW, I consider myself a real ham, and
>if you're
>injured my medical training forbids me from carrying you to the
>hospital. Unless
>you like things like permanent paralysis.

I liked Bill Gunshannon's posting as a response here. Most Hams have had at least a smidgen of training in how to handle an accident victim. I fully understand the ramifications of moving an injured person, and how it could result in a lawsuit in this sue-happy society; but I believe most of us would do what we could to help. I still think making calls on police frequencies will create more problems than it solves; and I don't think it is the most

```
expeditious method.

I remember the "SWING FISTS" on the  air.  They tapped out their code
in a musical way  that  was unintelligible as CW because the pauses
were all in the wrong places, yet consistant enough to sound sort of
like BOSSA NOVA.  They were more prevalent with straight keys.

>
>   Y.N. Miles,

I've found that my venerable TS-520 doesn't have a very wide range for loading on the lower bands - can't match much beyond 3:1 at full power. If your antenna is wildly nonresonant on 40 and 80, the pi network may not be able to match it.

I don't know what C26 is, but assume it is part of the LOAD capacitor that gets switched in for 40 meters. It's true that a hi VSWR could exceed your 500 wvdc - there are some equations relating SWR to voltage peaks (but I forget). Try loading up on a dummy load - if C26 is really blown, the LOAD knob won't be centered at full load, or you may not be able to load at all.

If the 40 meter antenna is nonresonant, you might want to invest in a Tuner. I've had some luck with the MFJ-949C, except that the switch isn't really rated 300 watts - it's ok at 100 watts, though.

>hams who don't like it can always QRM the transmissions to show kids what ham
>radio is all about...

Odd, according to my tracker hack, all of the passes close to North America occur between 11pm and 7am (PDT). Now, unless they have radically changed grade and high schools since when I was a kid (not that long ago), no school will be in session in North America, and most of those kids will be fast asleep. So I fail to see a collision of interests there.

Why wasn't that schedule ever posted here? All of the AMSAT bulletins I've seen make no reference to slotting; in fact, the only references were to operation from private stations. If there are some reserved slots, it would be the proverbial Good Thing to publicise them.

>On the other hand, there's always the packet robot for those of us without a
>sked.

Such packets might be music to your ears and mine, but not to the schoolkids you'll be QRMing, as the robot and Ron are operating on the same frequency (albeit not the same time). Check out the MET schedule, and then listen before hammering at the TNC.

Observation:

What we have here is....failure....to communicate. With all of the STS35 launch attempts, some of the details have obviously slipped through the cracks. It would be a Good Thing if, in the interim, somebody were to take all the existing bulletins, integrate, filter, and amplify them.

In rtodd@thoreau.nsc.com (=Ron Todd), Ron Todd says

> Having not done any quantative work on these systems I wonder:

Well, I had to go way back about 40 years for documentation on this one, to my notes from "Conversations with Dad".

1) Do they work better with a button on the end of the string
   or is knotted string better.

A knot (must be fairly large) works with waxed cups. However, the low-frequency response is better when you use half a popsicle stick. The capacity created by the larger surface area of the popsicle stick does a better job of passing the low frequencies than does knots, round sticks or even buttons.

> 2) How much improvment does the wax make.

The string to use is cotton twine, however it does have a very low velocity factor. Thoroughly waxing the string makes about 3 magnitudes increase in Vf. In fact, beeswax is suspected of increasing the linear admittance better any other material.

> 3) What is the attenuation per unit distance vs string
>   thickness/material.

No measurements were recorded in my notes, but a calculated approximation may be had by squaring the summation of voice frequencies present and dividing by the product of the mean diameter of the string, plus the square root of the coupling mode (button, stick or knot), and the result multiplied by the third derivative of the waxing medium's goo factor.

> 4) Is it necessary to match the cans or does a larger
>   can make a better transmitter or receiver.

It is not necessary to match the cans to effect a transfer of power. However, an impedance mismatch can occur due to the different resonant frequencies of dissimilar-sized cans. This mismatch can create large standing waves of sound on the string at a particular frequency. If the frequency at which the standing wave occurs is sufficiently low, it may cause premature failure of the string. You must consult a Jones Chart to find the frequencies at which failures can be expected to occur.

> 5) How well does an oatmeal box do compared to a coffee can.

My notes indicate that serious testing was conducted using various transceptors. Coffee cans (the metal kind) fared poorly in both response and volume. Far better were the waxed drinking cups and Quaker Oats "boxes". The choice between the two is simply a matter of preference. Those who like boomy bass would prefer the Q. O. box, while people who like crisp ambience and 1/2 inch speaker cables may prefer the waxed d. c. No experimentation was done with plastic containers, since these had not been invented at the time the study was conducted.

>6) Are the "synthetic" material cans any good, how about
the composite cans.

This question was answered in 5) above.

>7) Are aluminium cans better than steel.

No comparisons were made on these materials.

>8) What effect does string tension have.

Itzhak Perlman might say that string tension is the single most important factor in this design. The tension factor can be thought of as a steep-skirted bandpass filter; optimum tension is that which barely avoids coupling pullout. As tension is relaxed, the string impedance increases rapidly and capacitance to earth builds so that frequency response shifts quickly to the low end, then suddenly communication becomes impossible. This point is called the critical-laxity factor, cLf. If tension is increased beyond the optimum, frequency response of the system shifts toward the high end until the string impedance reaches infinity due to fiber failure. This point is the critical fiber factor, cFf.

If the coupling mode is a knot, coupling pullout may be reached long before cFf. In fact, it is possible for the optimum tension to occur just before coupling pullout. For all other coupling modes, the range of tension between cLf and cFf can be fairly narrow. Each system must be tested for its own innate characteristics may vary considerably from a seemingly identical one. Furthermore, operator training and experience is important in effecting reliable communication with these systems.

I wish to thank Ron for his well-thought-out, incisive questions.

73, and good canning!

```

I just returned from an airline trip, and took my 2 M HT. I made the trip with a single carry on bag, had the HT wrapped in some clothes for padding with the antenna in another compartment. This is an ICOM 02AT clone, same size as the ICOM and had an 8 cell battery pack. Also in my bag: 12 extra AA batteries, electric razor, small travel iron, car keys, some change, (those are the metal items) also a couple books and my clothes.

All flights were on United. At Portland, Oregon the bag went through X ray and nothing was said. In Indianapolis they wanted to see the travel iron, also asked if I had batteries in there. I showed them the travel iron, and asked if they wanted to see the radio. Response was "No, we could see that", meaning that it showed up on the X ray.

However coming back through Denver a woman said she needed to check the bag and proceeded to open it and completely scramble the contents. She was pawing through it making a *real* mess of everything. She pulled out my shaving kit and the travel iron and then sent the bag back through the X ray. Once again she opened the bag and started pawing through the contents after the "big metal thing". It was still wrapped up so I unwrapped it. She took it and held it up for the machine operator to see, and then gave it to me and walked back to the machine.

So, it is OK to take handhelds on the airlines, no one ever even said not to use it on the plane (I didn't use it nor ask if I could). The thing I learned is to be careful about letting them search the bags. This was a business trip, and I started out with shirts and ties very neatly folded. I'm lucky the search was at the end of the trip, else I would have had very wrinkled clothing (guess the travel iron would have been of use then :-).

BTW: Does anyone own a Santec ST-20T? I need a copy of the owner's manual.

YOU *enjoyed* learning the code. It wasn't hard (for YOU). As a matter
of fact, it was easy (for YOU). YOU do not believe that 5 wpm is a difficult
(for YOU) requirement.

OTHER people have found learning the code difficult. OTHER people have not
found learning code enjoyable. OTHER people have given up hope of becoming
amateur operators because of the code. OTHER people don't find the code
requirement relevant.

But, since the world revolves around YOU, none of this matters. YOU got
YOUR license. What do YOU care about OTHER people.

The following is from
     Nuclear Battlefields, Global Links in the Arms Race
     by William M. Arkin and Richard W. Fieldhouse,
     Ballinger Publishing, 1985

Page 31

"The military endlessly studies the effects of nuclear blasts on communications
[nuclear "blackout"] and has spawned numerous programs to provide the new
"endurance" requirements of a long-term nuclear war. "Following a nuclear

exchange", one miltary consultant has stated, "mobile [or proliferated] HF may well be the only long-haul communication resource that will survive intact" [G. Wetmore, "HF Radio: a Major Asset for 'Enduring C^3', Journal of Defense Electronics, May/June 1981] But HF is not the only frequency being examined. Groundwave communications are only moderately affected by nuclear explosions in the atmosphere. The military is examining VLF and LF frequencies because they are reliable, can penetrate sea water, and have relatively good performance in a nuclear-disturbed environment.

The key "enduring system is the Ground Wave Emergency Network [or GWEN]. GWEN will be a grid of 300 foot [tower height] unmanned relay stations, with EMP hardened LF transmitters and receivers. By transmitting "groundwaves", the radio signals will follow the earth's surface and will continue to functions in spite of the nuclear disruption of the ionosphere."

From Monitoring Times, August 1988, The "below 500 kHz" column.

The GWEN stations have been heard recently, after what was a fairly lengthy, rather quiet period. These send "packet radio" which requires special equipment to decipher or make sense of. With ordinary receivers, the sound can almost be described as hearing a couple of guys coughing. If you hear some unusual sounds in the 150-175 kHz area, it may well be some of the GWEN stations in operation. Information about them seems to be limited, as these are classified data.

Back to Nuclear Battlefields, Page 33.

"Another communications medium for use in nuclear war is "meteor burst communications" [MBC]. ... Billions of ionized meteor trails, constantly present in the atmosphere, can be used to reflect VHF radio signals. Due to the enormous amount of debris, and the wonders of modern technology, communications at the rate of 100 words per minute over distances of 1,200 miles can be reflected off the meteor trails. ... Since ionization would increase in a nuclear war, and thus enhance MBC communications, MBC plays a prominent role in the official fantasies of the post-attack communications. "

{So if you want to emulate the government after a nuclear war try either the Lowfer band (160-190 kHz) (Part 15) or 6 meter meteor scatter packet radio.}

>   1) What is the legal limit of wattage or whatever a person
>   can broadcast at without an FCC license?

My recollection is 100 mW (that's MILLIwatts) DC input; there are also, I believe, restrictions on antenna length and height. The overall result is that you'll be very lucky to get a range of more than a couple of hundred feet or so to most broadcast receivers.

>   2) Does anyone know where I can find schematics and plans
>   to do this?

There are a number of simple "AM transmitter" construction projects in hobbyist-type books; check at your local library or Radio Shack. (RS used to have a kit for an AM transmitter, as well as for an FM "wireless mike"). However, please keep in mind that the restrictions are such that any license-free setup will be little more than a toy; you certainly can't build a "real" station - meaning one with any meaningful coverage at all - without an FCC license, and the requirements for a broadcast license are such that it is VERY unlikely that an individual could build a licensable station as a "home project." And if, with that said, you're tempted to set up as a "pirate" station...well, the FCC has a remarkable lack of a sense of humor about such things, and rightly so.

About the only way that a "broadcast" outlet can be set up *relatively* cheaply and hassle-free is the "carrier-current" type of station, as used by many college dormitories. This arrangement basically uses the building's AC wiring to carry a low-level signal, which again is very unlikely to make it very far outside the building.

At first I was going to suggest one of the el-cheapo 567 detectors that was
in the ham magazines in the late 1970s, until I read:

>
> I would prefer one that translates to ASCII, but I will
> look at anything that doesn't require my CPU to poll a
> line for transitions.

If you want one that puts out ASCII, you need one of the multimode
controller boxes, like the AEA PK232. This will do other modes (like
packet, AMTOR, Baudot, etc) too.

A couple of years back, a friend (WB2BQW) and myself tested a spool of
yellow RG-8 Ethernet Cable. It was pure garbage. It does meet the spec
for RG-8 but just barely. It exhibited more attenuation at all freq.
above 30 Mhz than even the mini-foam RG-8 sold in places like Radio Shack.
I would consider it only as a last resort and definitely not for VHF and
up.

Your mileage may vary.

Somebody asked about a mod for 2sat that will allow receive 108-140MHZ AM

and other freq. To unlock VFO, turn set off. Press and hold simultaneously (at the same time) #, B, and light keys. TUrn set on and hold these keys for three or four seconds. You will get all kinds of stuff on display, but after all settles down, your VFO will be unlocked and you get:
108-140MHZ AM, 138-169MHZ FM and 310-370MHZ FM. These for sure, maybe more.
THis is receive only. Good Luck.

First of all CATV hardline is 75 Ohms, The thick yellow Ethernet stuff is 50 Ohms. I would say that per 100 Meters the Heavy solid aluminium jacket CATV stuff has less loss than Ethernet cable.

But the question I would like answered myself is, how does the yellow jacketed thick Ethernet cable compare to RG8U? The RG8U cable is designed for outdoor use, we can assume that the designer yellow stuff is not. Now thin Ethernet cable is RG58u, plain and simple. So why the yellow stuff for thick cable?

My Belden catty (Master Catalog 885) Page 187 has Ethernet thick cable - Yes there is a plenum version available to keep the cranky building inspectors at bay. The specs say it is 50 Ohm. The insulation is Cellular Polyethylene (Foamed Teflon for the plenum stuff). The OD is 10.28 mm for regular and 9.53 mm for the plenum stuff. Now Belden 8214 (RG8/u type) has an OD of 10.29. These dimensions are to help those who would want to stuff the cable into a regular 50 Ohm N connector.

As this is Ethernet cable and it has recommended working distances, Belden don't bother to post the attenuation figures. My guess is that would be about the same as regular RG8. If you can get this stuff free and can live with the trendy yellow jacket, make the best of it.

Maybe someone else has the actual attenuation figures of this stuff. Maybe someone could also explain why not use RG8 for Ethernet cable. I don't know what the price difference between Ethernet cable and RG8 is. That alone may explain much.

Notice how Mike's sentence starts with the word "I". His point was to relate his personal experience. Lighten up - it wasn't aimed to belittle you. The way to get NO-CODE is through comprimise and reasonable thought, it is *NOT* to try to make those who learned and enjoyed CW feel guilty about it.

What does "difficult" mean to YOU? You want to be able to do it in 10 minutes? Ptpth. Most people are perfectly capable of learning CW. It takes time and effort, too. The new changes in testing procedures for the handicapped encourage it. Try arguing about whether or not it is NECESSARY to have CW tests; that's a little more to the point.

Pete,

A small antenna is antithetical to high gain at VHF. I don't know that you could put it up, but a wire rhombic can have quite high gain. You can make one out of hookup wire but you'll need to be able support it at four points at least 15' above the ground, perhaps one support point could be your building.

I'll have to go verify the dimensions, but a high band TV rhombic about 35 feet across the narrow way (orthogonal to direction of station) and 120 feet the long way, terminated at the far end can be fed with 300 ohm twinlead and perform better than the best commercial antenna you can buy.

I think the question is wheter you could get the powers-that-be to let you install a wire rhombus of that size...

Let me know if you need more detail, I have some numbers around here somewhere (as well as a Collins radio paper on rhombics from the '50s).

>Gary KE4ZV

Gary, I'm very disturbed by your lack of thought concerning my posting. In the beginning of my posting, I prefaced it with *I* ... These were *my* feelings; I was not attempting to say that 'this is the way it is'.

You, on the other hand, displayed a true lack of 'brotherhood' in the advancement of ham radio. Yes, I agree that certain people have trouble learning the code. I maintain that in most of these cases, it is because 1) they choose to have a hard time at it by a lack of HONEST effort over a period of time and 2) because people like you promote the attitude that its silly and you don't need to learn it. "You can cheat your way through this way: let me show you. "

I'm sorry you have had such a bad experience with CW. I tend to think that CW is a necessary barrier of entry. I think of Ham Radio much the same waay as music. (I have been a musician for 18 years.) Many people want to be a musician and (for instance) play the guitar. Playing the guitar takes several things: Time, desire, ambition, patience, diligence and PRACTICE. If even one of these things is lacking, the person will not be successful in learning the instrument. (By the way, there's no way to cheat on a guitar test.) I submit that the same requirements exist for learning the code for the ham radio tests.

Gary, I do hope that you can learn to further the efforts of ham radio operators in a more respected manner than what you are displaying. It is a worthy hobby of talented and willing individuals. Perhaps one of the reason the code requirement exists is to keep out people who will be a detriment to the radio community as a whole. (I bring to mind the recent 20 meter wars, and also leave you to think of the deplorable condition of 11 meters.)

I, personally, will continue with my enjoyment of CW and will more than

gladly put forth the honest time and effort to speed up to 13 and even
20 WPM. It will be difficult, but after playing the acoustic guitar for
over 16 years, I know what diligence is and how it pays off. While my
primary use of the bands will be voice usage after I upgrade, I feel that
CW is necessary. And, I hope that my mentor (I fear to call him an Elmer,
his hair isn't grey enough! :-)) doesn't have such discouraging words
as you do. Otherwise, I would probably abandon ham radio completely.

Several months ago someone posted an article listing
VLF time and frequency standard stations. This list
covered about 16kHz to 200 kHz. I am wondering if
anyone has a list covering all VLF stations from
10 kHz to about 100 kHz. If you have one, please post
it or mail it. Thanks.

In the past, Bob Parnass has posted instructions here for reducing squelch hysteresis for a variety of scanners (the article is titled "Improve the Squelch in your Monitor Receiver"). It included instructions for various Radio Shack scanners, but not the 2005. I've made the change to my 2005; here's the info for anyone else who'd like to do the same.

First the problem: the 2005's squelch has a considerable amount of hysteresis, so that once the scanner has "latched onto" a station, it will stay on-channel until the transmission has ended, even if the signal strength is varying. Unfortunately, if you set the squelch high enough so that it remains squelched on unused channels, the scanner will miss weak stations entirely. If you reduce the squelch control to receive the weak stations, the scanner will not scan - it stops on every channel.

Modifying the radio to reduce the squelch hysteresis allows very weak signals to trip the squelch - you can scan for weaker stations. The price you pay is that varying signal strength will cause the squelch to "pop" in and out, and the receiver may resume scanning in the midst of a call. Even if you set the squelch control higher to receive only stronger channels, they are still subject to popping - it's the change in strength that matters. By adjusting the value of the resistor that provides hysteresis, you can select any tradeoff between extra sensitivity and popping.

Next, the warning: The PRO-2005 uses mostly surface-mount components, which are considerably harder to work with than standard ones. If you haven't worked with surface-mount before, don't make this your first project. The resistors are held on the board both with solder and a small dab of glue, so this isn't going to be easy. I did OK with a temperature-controlled soldering iron, desoldering wick, and an X-acto knife; commercial equipment intended for working with surface mount parts would be better.

You should also obtain the service manual for the scanner - it will help you understand what is going on.

The basic info: If you've had your 2005 apart before, and are familiar with it, here's all you need to know: The squelch hysteresis is set by resistor R152, a 33 K-ohm resistor on the underside of the linear board, connected between pins 12 and 14 of IC2. IC2 is a TK10420, the 16-pin DIP closest to the front of the scanner on the linear board.

The original resistor is a so-called "0805"-series resistor - this means it's .080 by .050 inches in size. Replacing it with another surface-mount part is neatest, but you can use a conventional 1/8-W resistor as well, and this is probably best if you're going to experiment with different values. I replaced my R152 with a 220 K resistor, and this gives somewhat too little hysteresis for my taste. You might want to try 150 K or 200K instead.

More detailed instructions: There are 3 main circuit boards in the scanner. The large one visible when the scanner's top is removed is the "linear" board. The smaller board revealed by removing the bottom cover is the "PLL" board. And the one behind the front panel is the "CPU" board. Major disassembly is required to get at R152:

- unplug scanner, remove backup battery

- remove top and bottom covers

- disconnect all connectors connecting the linear board to the two other boards, including 2 coax cables between PLL and linear board

- remove the front panel and its ground straps (6 screws). (If you want to change the configuration-setting diodes, this is the time to do it).

- it makes reassembly easier if you remove the PLL board at this point, though it isn't absolutely necessary

- remove all screws holding the linear board in place. There are 13:

    - 2 holding the external antenna jack and attenuator switch subpanel to the rear panel
    - 2 holding Q32 and IC8 to the frame for heatsinking
    - 9 holding the PCB itself. One of these is *inside* the metal shield can that is nearest the scanner front

- unsolder power transformer and backup battery wires if you wish (not strictly necessary)

- if you did not remove the PLL board, pry up the front of the linear board until it disengages from the 4-pin connector on the PLL board that comes through a hole in the chassis

- pull the linear board forward to disengage the jacks from the rear of the chassis

- find IC2 (TK10420), the 16-pin DIP nearest the front of the board. R152 is below the body of IC2 on the other side of the board, connected between pins 12 and 14

- remove R152 with whatever means you have, then solder in the new resistor.

- reassemble in the reverse order, with the following notes:

    - if you didn not remove the PLL board, use great care in re-installing the linear board to ensure that the 4-pin connector joining the two boards aligns correctly. You may have to bend one side to make this happen.

    - if you did remove the PLL board, re-install it after the linear board, and make sure the 4-pin connector lines up properly

    - note that the screws that hold Q32 and IC8 are longer than those that hold the circuit board

As usual, this will visibly void the warrany of your scanner, so proceed carefully and don't break anything!

Hello !

I wonder if anyone out there knows if low powered unlicensed xmtrs operating
in the 88 to 108 Mhz band are legal and what is the max output power ?
Or a reference as to where I might find this information...

Thanks,
Thad   KG5ES

Gary says he used the gimmic (writing the dots and dashes) to pass his Advanced.
Say, Gary, did you go straight to Advanced from 5WPM?   Anyway, I'd really
love to see a repeat performance. I tried doing that and found it harder to
learn to do that than to learn the code.

The problem is not that NASA "oversold" the shuttle program. (They did this, but it's not the biggest problem.) The real problem is that NASA has not received sufficient funding since the days of Apollo. They had no choice but to develop as cheap a manned space vehicle as possible. The U.S. government, and the American people, expect a turbo-Porsche from NASA but are only willing to pay for a Yugo. As it is, NASA has received funding for a Yugo but at least have produced a Chevy. Chevys break down a lot, but they work.

We should be thankful for what we've gotten from NASA, considering the low funding they've received. I remember when Reagan told NASA that "the shuttle program will have to pay for itself." This unreasonable demand forced the agency to schedule far too many shuttle missions in 1986, which is one of the biggest reasons why the Challenger was launched on that cold January morning.

I know that hams and the rest of the country are frustrated with the shuttle program right now, but in my opinion, the country is getting what it deserves.

It is quite fun to build your own QRP CW rig. I built a "Tuna Tin 2" from the ARRL's "Weekend Projects" book and had a lot of fun with it.

However, I would not encourage new hams to do this. As an inexperienced operator, you will become frustrated with your 1/2 watt signal. You won't make many QSOs, you'll get frustrated, and then you might even give up the hobby.

You are better off hunting down an old tube-type transmitter at a hamfest. I started with a Drake TR4, and was quite happy with it until I sold it, so I could buy an ICOM 735.

I would recommend Doug DeMaw's "Help for New Hams", which is sold by the ARRL. Doug also wrote the article about the "Tuna Tin 2". His advice for new HF hams is to run about 100 watts to start, and then to go to QRP when you've gained experience.

I recall that there was a satellite active a few years back called ats1. This bird handled communications from scientists at the south pole back to the us. The frequency used was around 136mhz. Is this bird still active? If not, where are the communications from the pole taking place? I know that other ats birds have been launched. Do they still use vhf 136mhz? Any information would be appreciated.

In article <251@bongo.UUCP> julian@bongo.UUCP (Julian Macassey) writes:

> I noticed on Page 15 that on of the picture captions said: "...The PC is used to log contacts and communicate via Inmarsat." I wondered why, they had a boat offshore, which according to the story had full Nav and Comms. Why, with all that Amateur Radio gear around on this storm lashed piece of rock do they need to chopper in an Inmarsat terminal? Must be so they can assure the XYLs at home that they are eating well and sending out their laundry.
>
> than 25 hours of hard labour, punctuated by only a few hours of sleep, we were quite exhausted. Happy and ready for the DX operation, we moved up to 14.145 MHz and Einar worked LA6VM as the first station."
>
> Only a cynic would envision a scenario where an exchange is made via Inmarsat to schedule a CW QSO on 20 Meters. Amazing where technology has taken us.

I certainly don't have a problem with a DXpedition handing out the first contact to someone who was a major force in making the trip happen but who stayed home to coordinate things at that end. As you'll notice from the article, LA6VM was one of the founders of Club Bouvet as well as its QSL manager. He provided invaluable assistance in gathering the funds and equipment necessary for this trip, as he did a few years ago for the first-ever Peter I DXpedition.

I think having alternate comms capability with your support staff back home is an excellent idea. I've heard DXpeditions trying to get important information back to their families and ham assistants on 20m. Sometimes they get interrupted (or jammed :-( ) by other people.

The Inmarsat idea sounds smart to me.

Patty

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==

Data for each satellite consists of three lines in the following format:

```

1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

Line 2

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
10-11	International Designator (Last two digits of launch year)
12-14	International Designator (Launch number of the year)
15-17	International Designator (Piece of launch)
19-20	Epoch Year (Last two digits of year)
21-32	Epoch (Julian Day and fractional portion of the day)
34-43	First Time Derivative of the Mean Motion

	or Ballistic Coefficient (Depending on ephemeris type)
45-52	Second Time Derivative of Mean Motion (decimal point assumed; blank if N/A)
54-61	BSTAR drag term if GP4 general perturbation theory was used. Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63	Ephemeris type
65-68	Element number
69-69	Check Sum (Modulo 10) (Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)

Line 3

Column	Description
01-01	Line Number of Element Data
03-07	Satellite Number
09-16	Inclination [Degrees]
18-25	Right Ascension of the Ascending Node [Degrees]
27-33	Eccentricity (decimal point assumed)
35-42	Argument of Perigee [Degrees]
44-51	Mean Anomaly [Degrees]
53-63	Mean Motion [Revs per day]
64-68	Revolution number at epoch [Revs]
69-69	Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

```
NOAA 6
1 11416U          86 50.28438588 0.00000140           67960-4 0  5293
2 11416  98.5105  69.3305 0012788  63.2828 296.9658 14.24899292346978
```

Note that the International Designator fields are usually blank, as issued in the NASA Prediction Bulletins.

> >call WV7XNN...the WV7 prefix would be kosher, but the XNN suffix is a no-no.
> What is wrong with the XNN suffix?

2x3 callsigns with suffixes beginning with X aren't used in the amateur service; they're reserved for Part 5 experimental stations. About 12 years ago or so, the FCC issued a bunch of WB5Xxx calls; they all were issued replacement licenses when the FCC realized their mistake. If you hear someone signing WB5Yxx, ask them...chances are that they got an X-call first.

julian@bongo.UUCP (Julian Macassey) roguishly sez:
----
those amazing coincidences that makes life so worth while: "After more than 25 hours of hard labour, punctuated by only a few hours of sleep, we were quite exhausted. Happy and ready for the DX operation, we moved up to 14.145 MHz and Einar worked LA6VM as the first station."

Only a cynic would envision a scenario where an exchange is made via Inmarsat to schedule a CW QSO on 20 Meters. Amazing where technology has taken us. I assume all the CW gear was to back up the Inmarsat terminal (-:

Well, 14145 is only a CW freq in the USA (although the 3Y5X operation might have you believe otherwise). No, 14145 from Bouvet and from Norway is that

old-fashioned talking-type Shouting, Screaming and Barking mode (it's usually abbreviated "SSB"). No way they could get on and call LA6VM ("others please stand by, this is 3Y5X"). OK, it might not have worked on CW either, but you can't use this incident as an excuse for CW-bashing.

Patty's right, if I were the QSL manager and major organizer of a thing like this, I'd want a QSO for sure. It's actually quite conceivable that LA6VM was on the qui vive hourly, but yes, they probably did use the other link to set up the schedule. I would have done that too.

But regardless of the above, one does have to wonder about the sanity of the whole thing. Of course, it wasn't just a ham radio visit, there were biologists and such (see page 16 picture of two penguins being strangled to keep the population down), but in this case they tagged along with the radio guys, rather than the other way around as often happens with these things. You can't get much for $330,000 these days, and the various postal services did quite well out of the operation.

I gave the airline security guys a fright with my ham gear this summer.
Travelling from Honolulu to San Francisco, I had packed a 2 meter
handheld and a bunch of spare battery packs. Just for good measure
I threw in the wall charger and the speaker mic too, just stuffed
into a small box.

It must have looked like a standard Hollywood mad bomber device on the
X-ray scanner. Drew a crowd of security, until I told them that it was
just a bunch of radio parts.

The moral of the story is: pack neatly, and try not to carry a slew
of battery packs around. Besides, they are heavy!

--- SOLAR TERRESTRIAL REVIEW ---

August and September 1990

Report Issued from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK SEPTEMBER 1990 - MARCH 1991

We are now in month 48 of solar cycle 22. Average activity levels and solar indices made a substantial increase in August. Daily values for 10 cm flux, sunspot number and sunspot area reached some of the highest values observed yet this year. In particular, the 10 cm flux value of 315 observed on 26 August was the highest since the 321 observed on 16 June 1989 and the sunspot number of 18 August (394 observed at Boulder) was the highest value since the 395 observed on 10 September 1989. The increases in these indices was sufficient to produce a slight increase in the smoothed values for February 1990. In response to this increase in the smoothed sunspot numbers, the prediction model has risen a little for the next few months, however, not enough to result in a new cycle maximum being predicted. The sharp rise in average smoothed sunspot numbers over the last two months gives a definite impression that the possibility indeed exists for the solar cycle to rise past its July 1989 mark of 158.1. Although to do so it would require several more months of activity equal to that of August's levels.

Flare activity was also up in August. Nearly double the number of energetic events observed in July. Including the largest flare in more than three months, an X3/2B Tenflare with type IV radio sweep from Region 6233 at 21:06 UT on 27 August. This region was by far the most active, producing nearly half of the energetic events observed. Other activity of interest included a satellite level proton event which began at 00:05 UT on 01 August and ended at 11:45 UT on 03 August after reaching a maximum of 230 pfu at 20:15 UT on 01 August. A slight Forbush decrease and a 5 db polar cap absorption accompanied this event.

This activity was most likely in response to a long duration M4/2B flare from Region 6180 on 27 July. There were two days of geomagnetic storming at middle latitudes and eight days at high latitudes, including one day of severe storm levels on 23 August. A large filament which disappeared 17-18 August is believed responsible for the 23 August activity.

The increase in activity observed in August may be the beginning of the peak that has been anticipated for several months and is expected to occur in September or October (although very recent analysis indicates that this potential peak may not materialize until October or perhaps November). In any case, this increase in activity lends credence to the belief that solar cycle 22 will have an extended maximum with numerous periods of both high and low activity through 1992.

RECENT SOLAR INDICES (PRELIMINARY) OF THE OBSERVED MONTHLY MEAN VALUES

YEAR = 1988

I need to put together weather satellite receiving station
for GEOS birds. I need the best resolution and and the best
gray scale possible. The output will end up on IBM
compatible computers. I believe I would prefer separate
receiver and WFAX board. I am also interested in the higher
resolution data available from both the GEOS and low orbit
birds.
   Any help welcome.

    |_________________________________________________________________|
```

NOTES:

This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.

"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).

For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie.

non-proportionally) when plot lines exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines match or exceed Severe Storm levels.

```

NOTES:

Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

    ------------------------------------------------------------
               Cumulative 60 day Solar Activity Record
```

Start Date: August 1, 1990

NOTES:

Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

NOTES:

Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because you may not be able to see auroral activity (due to lunar phase, for example) does not mean auroral activity isn't in progress. For best observing conditions, get away from bright city lights.

I have a problem whereby my FT-101E refuses to load up on 40 meters. ALl other bands work find, but 40 refuses to load up. I haave been operating into a high vswr on 40 meters and wonder if I have blown C26, which is 470 pf rated at 500 wbvdc.   Any suggestions would be appreciated, as the rig works fine on all other bands.

Y.N. Miles,
<TRIUMFcl.bitnet>

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I don't get this message. The FCC law is quite clear that any frequency may be used under certain conditions. My TR-2600A covers 140-160 Mhz as a transceiver, and I wouldn't hesitate one moment to use it to contact a public service agency in the event of a situation in which property or life was at imminent loss. On the other hand, I'd prefer more conventional means (such as using the telephone, etc.).

Be sensible. Most public service agencies probably use CTCSS; do you know the correct frequency to use? They don't tell you this in a scanner frequency listing. Furthermore, many public service radio systems are configured with repeaters, etc; the published frequency may be a repeater output and there is little chance of anyone hearing you on it. Concentrate on methods which get the best results. Contacting law enforcement agencies via the telephone will generally work best.

If, for instance, you are in an airplane crash, and there is no nearby telephone but you have a radio and can contact the US Forest Service, I sincerely doubt you'd be in trouble.

I'm moving to Nacogdoches, Texas to take a faculty position there and would be interested in a contact or contacts I might rag chew with to get info on the area weather, pros and cons, repeaters, etc... I'm also interested in info on packet but will post that in the packet newsgroup. Will be prof in the School of Forestry at Stephen F. Austin State University. Arrival about the first week of December.....

Cud ragchew on HF or via packet....

The South Pole has used a satellite called ATS-3 for the past several years. It has been used to transfer data over a synchronous data link to a ground station in Florida, as well as for voice comms over a narrow band FM link to the same ground station.

ATS-1 is part of the same series of satellites launched circa 1967. The had a life expectancy of 3 years, so it's kind of amazing they're still running. Both ATS-1 and ATS-3 are active and use the same frequencies on the transponders as questioned above. The transponders are different, but both pass FM. ATS-1 is west of ATS-3, and serves several satellite users throughout the Pacific. ATS-3 has many users in addition to the Antarctic stations and so time is shared. But you should still hear South Pole, McMurdo Station, and Palmer Station come up occasionally.

South Pole however has moved over to another satellite, LES-9, an Airforce satellite operation on higher frequencies. The other stations hopefully will soon follow. The data links on ATS-3 were running at 1200 baud (2400 baud possible but not reliable), and the LES-9 operations take place at 2400 baud. LES-9 does not have a transponder, rather many repeaters on different channels. Voice is possible, however for the time being, Pole will just be using it for data. ATS-3 will continue to be used for the voice traffic. You would need a synchronous modem to decode the data, but even then it's all encryped and so not much use to anyone.

Voice on ATS-3 is used fairly infrequently except weekends when people call home. But even then it's only about as interesting as listening in on 20M phone patches.

Technical data on all three satellites is public info, and can be found in your local library in a good book on communications satellites.
Enjoy!

One disadvantage of the AEA boxes is that they aren't very tolerant
of a bad "fist". If the intracharacter timing is a little long,
all you get is a string of E's and T's. In one of the manuals,
they claim this as a feature, to help with training one's sending.

Also tuning is fairly critical, the input filters are about
100 Hz wide, and at a fixed frequency. (800 Hz on the PK-232, and
1000 Hz (slightly adjustable) on the older MBA units.)

Hmmmm....I was WN7CSK in 1965, then WA7CSK a year later. I don't think
there were any W calls still being assigned when the Novice was in
effect....or am I wrong? Had some areas not gone to KN and K in the
1950s?

Hello fellow netlanders,

As a new ham, I (and my wallet) are looking at HTs to purchase. The decision seems to be coming down to a choice between the Yaesu HT-470 and the ICOM 24AT. I was just about to decide on the Yeasu (lower price, >= features) when this salesman ambles up. His claim was that the Yeasu is a fine ham-bands only machine, but that if I ever wanted it to do anyting else I would be disappointed.. i.e using it with a rooftop antenna for more range or packet would be almost impossible because of intermod - the squelch would never drop so I could never transmit.

Well, I'm not sure I want to DO packet, but I would hate to limit my options.

Any feedback would be appreciated.. Was the salesmans claim valid, or was I being steered to a higher margin device?

Thanks!

-Rick-

SB RTTYDX @ ALLBBS $RTDX0928
RTTY DX Notes 1of3 9/28/90

RTTY DX Notes for week ending 28th September 1990
BID: $RTDX0928
Part 1 of 3.

From reports received this week, indications are that the bands are going through a change as shown by the numerous reports of activity on both 21 and 28 MHz. These conditions should prove exceedingly helpful with the CQWW RTTY DX Contest this weekend, and final scores should be very interesting. See you in the mess.

Our thanks this week go to I5FLN (and cluster), JA1BLV, OD5NG TG9VT, UT5RP, VK2EG, W2JGR, W6/G0AZT and the Tri-State DX Packet Cluster Network. I see that you have all been busy this past week. Thank you all for the wealth of information.

RTTY DX Notes 3of3 9/28/90

RTTY DX Notes for week ending 28th September 1990
BID: $RTDX0930
Part 3 of 3.

Thursday 27:

SV0ER	14074	at	0400Z	ARQ
EA8BIL	14074	at	0415Z	ARQ
UG7GWG	14098	at	0444Z	QSL
ZF1RY	14091	at	0501Z	
GW4ZAT/5B4	14073	at	0630Z	FEC

QSL Information:

Correction to ZF1RY QSL path. Send cards to P.O. Box 5194, Richmond, CA 94805. The Callbook address may give the wrong impression.

7J1AJD/JD1 will QSL via KB1BE.

FW1FM indicates to QSL via Box 15, Futuna Island.

RO4OA will collect his cards from Box 249, Kishinev 277043, USSR.

JH1QDB/JD1 says to QSL to his home address.

BZ4RC is at Box 538, Nanjing, P.R. China.

UG7GWY says to QSL to Box 1, Erevan 375038 Armenia.

V73AT will QSL via K2CL.

UH7E/UZ9CWA cards go via UZ9CWA.

4U1UN requests his cards via NA2K.

UG7GWG collects his cards from Box 54, Erevan 375010 USSR.

Notes of Interest:

7J1AJD/JD1 will operate until October 4th and will include the CQWW RTTY Contest in his effort.

HJ3MCM is a special Colombian call.

OM3BXW is also a special call for OK3BXW.

BV4VB states he will be very active in the CQWW RTTY DX Contest this weekend, as will 7J1AJD/JD1, JH1QDB/JD1, ZF1RY and many other good callsigns.

Saint Pauls Island CY0. FP5DX and VE1KM are scheduled to operate from October 20th with RTTY (and other modes) on 15 and 20 meters. Expected calls are CY9SPI and CY9DX. QSL via FP5DX.

Angola D2 is in the cooking pot as soon as official permission is obtained. It is hoped that RTTY will be included in the operation.

GL DE DX1.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.
/EX

Greetings. On Sunday, September 30, agreement was reached by the federal budget negotiators on a proposed new budget, including a variety of program cuts and new/increased taxes. Ignoring the other taxes for the moment (e.g. increases in gasoline tax, energy tax, social security taxes, etc.) there is one brand new tax in the agreement that might be of particular importance to readers of this forum. This is a new "luxury" tax of 10%. Details are sketchy, but it apparently is proposed that this tax will apply on items such as "luxury cars", furs, jewelry, and *electronic equipment*.

As this message is written, it is unclear what that latter category would include. Would it include telecommunications and computer equipment, or "only" televisions, VCR's, stereos, etc. above a certain selling price? Would it apply only to individuals, or to business use of such equipment as well? Would this tax simply be added on to existing state and local taxes at the consumer level?

It might be worthwhile for everyone who is involved in the purchase of "electronic equipment" to carefully track the details of this significant new proposed tax as they come forth, and make their opinions known to their House/Senate members (opinions phoned in *do* get counted by their offices). At this stage, the budget agreement has not yet been approved by Congress, and while the leadership will no doubt wish to have the entire package accepted in one piece, it is not necessarily the case that changes won't be made. It is important that our representatives be informed about the feelings of the technical community concerning these specific proposals.

What frequencies do the little hand held remotes, used to arm and disarm automobile alarm systems, transmit on? I've disassembled a couple and have never found a crystal, just a single chip and a bank of DIP switches. Are the frequencies varied as part of the encoding process?

Is there any known way to get the IC24 to accept a repeater offset in other than 25khz steps? There are a number of repeaters with oddball offsets and as it stands there doesn't seem to be a way to deal with them (using only one radio, anyway...) Thanks much.

> Gary, I'm very disturbed by your lack of thought concerning my posting.
> In the beginning of my posting, I prefaced it with *I* ... These were *my*
> feelings; I was not attempting to say that 'this is the way it is'.

The fact that you did not do so on the sentence regarding how easy the 5 WPM code test is, others, such as maybe Gary, might have taken it as a statement of generality.

> You, on the other hand, displayed a true lack of 'brotherhood' in the
> advancement of ham radio. Yes, I agree that certain people have trouble
> learning the code. I maintain that in most of these cases, it is because
> 1) they choose to have a hard time at it by a lack of HONEST effort over
> a period of time and 2) because people like you promote the attitude that
> its silly and you don't need to learn it. "You can cheat your way through
> this way: let me show you. "

There are people who have trouble learning code or many other things due to not putting the proper work into it. But that does not account for all the people who have trouble learning. There are legitimate reasons. One of them is people who are profoundly deaf, and the current FCC changes do NOT account for that, because the waiver does not apply to the 5 WPM test, which they cannot pass "by ear". Next there really are people who just cannot learn code at all.

Like you, I found that Morse Code was easy to learn. I spent about 6 hours of study on it outside of the 5 class sessions, and that was enough (just barely enough) to pass the test. I have since forgotten it.

Is the Morse Code requirement silly? Longtime readers of this newsgroup already know how *I* feel about it. But I suggest that the position is a personal one for each individual.

> I'm sorry you have had such a bad experience with CW. I tend to think
> that CW is a necessary barrier of entry. I think of Ham Radio much the
> same waay as music. (I have been a musician for 18 years.) Many people
> want to be a musician and (for instance) play the guitar. Playing the guitar

> takes several things: Time, desire, ambition, patience, diligence and PRACTICE. If even one of these things is lacking, the person will not be successful in learning the instrument. (By the way, there's no way to cheat on a guitar test.) I submit that the same requirements exist for learning the code for the ham radio tests.

There are many successful musicians who cannot play the guitar. Can you play the piano. Would you require passing a guitar test in order to allow someone the privilege to sing?

The things you mention, "time, desire, ambition, patience, diligence and practice" are definitely needed ... if Morse Code is the mode you want to operate. And you have already mentioned that you like it.

But like the guitar test would have no purpose for someone who is not going to play a guitar, the Morse Code test has no purpose for someone who is not going to use Morse Code. There are certainly many people who do use Morse Code in ham radio just as there are many musicians who play guitar (I even know some who do both).

> Gary, I do hope that you can learn to further the efforts of ham radio operators in a more respected manner than what you are displaying. It is a worthy hobby of talented and willing individuals. Perhaps one of the reason the code requirement exists is to keep out people who will be a detriment to the radio community as a whole. (I bring to mind the recent 20 meter wars, and also leave you to think of the deplorable condition of 11 meters.)

The participants of the 20 meters mess either passed the code test, or else cheated somewhere along the line. In either case, the existance of the code test did not keep them out.

> I, personally, will continue with my enjoyment of CW and will more than gladly put forth the honest time and effort to speed up to 13 and even 20 WPM. It will be difficult, but after playing the acoustic guitar for over 16 years, I know what diligence is and how it pays off. While my primary use of the bands will be voice usage after I upgrade, I feel that CW is necessary. And, I hope that my mentor (I fear to call him an Elmer, his hair isn't grey enough! :-)) doesn't have such discouraging words as you do. Otherwise, I would probably abandon ham radio completely.

I don't think Gary would have been that way with someone he was helping to get into the hobby. Like myself, Gary would be happy to encourage someone to learn code and get into the hobby, even if he knew (and probably even more so because of it) that person was primarily interested in just CW. There are people like that still coming into the hobby.

Let me ask you if you would have been so diligent at learning the guitar if all you were really interested in doing in music was to sing, but to get a "permit" to sing, you had to first learn how to play the guitar?

Or let's reverse this a little. Suppose in order to get to play the guitar in public, you had to learn to play the oboe and pass a test on the oboe?

Would you be so diligent at playing the oboe?

I want to thank all the folks who wrote me regarding my original posting regarding the navy ASW (Anti Submarine Warfare) activities on 11191 khz. Since my original posting, I have listened a few dozen hours to the utility, and done more research. Here is more info for all who have been tuning in and wondering what all the cryptospeak means:

Most stations have two or three character ID designators.

Station FT (Foxtrot Tango) always has a databurst before he starts talking, and data runs under him.

Stations exchange one another's PAPA UNIFORM, which is either a selcall, or a decryption key, or both.

One of the stations every morning (between 0600 and sunrise) has a tactical ID, such as DRAWKNIFE, During a three day period, each night I heard: Drawknife, Drawknife Alpha and Drawknife Bravo. Other similar tactical callsigns have been heard.

NUKE-O does indeed refer to encrypted traffic. It is not "new code" as one poster thought, but: NUCO

for:

NATO
UNIFORM
CODE of

OPERATIONS

When a station says NUCO, all information following is encoded, and when they say UN-NUCO, then the encryption is over.

So when someone NUCO's information, it is encoded.

ALIGATOR is apparently an Air Force AWACS plane, and it is possible that this station is the TACTICAL one.

The secure channels are on UHF (I confirmed this two nights ago).

The operations every morning are most likely an excercise practice.

During the day, activity on 11191 are quite different. It sounds more like a SAC channel. The daytime alternate frequency given is 6712khz.

Hope the above is helpful.

More than one person who wrote experessed an interest in more UTE postings, and even a UTE group, or UTE mailing list. I don't believe there are enough folks out there to support such a group, but I think postings to rec.radio.shortwave would be appropriate.

I am also crossposting this to rec.ham-radio, with replies to rec.radio.shortwave.

KEEP MONITORING!

> output and there is little chance of anyone hearing you on it. Concentrate
> on methods which get the best results. Contacting law enforcement agencies
> via the telephone will generally work best.

I know the repeater input frequency and the CTCSS tone frequency for each of the frequencies in use in my area. This can be a problem with travelling.

How did I find out what the CTCSS tone was? Well once I figured out what the input frequency was, I found I really could hear many transmission on there (so in turn they could have heard mine if I transmitted on the output frequency) and I was able to figure out their CTCSS using my tone squelch feature I added to the radio.

By the way, for low-UHF repeater pairs, the standard 5 MHz offset applies.

I have programmed a few of the frequencies in memories. I set the transmit offset to the correct amount but in the WRONG direction. This will reduce the chances of causing accidental interference, but still be a means to get to the correct frequency should an applicable emergency come up.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 1 of 4

DEFENSE PULLS OUT OF DRILL

U.S. involvement in the Middle East has forced a major Amateur Radio-government emergency exercise to be scaled back. The National Disaster Medical System (NDMS) steering committee, acting on a notice from the Department of Defense, has cancelled a full scale drill scheduled for Oct. 10-13, but local drills still may be carried out as planned.

In a letter from Peter B. Collis, M.D., Deputy Assistant Secretary of Defense, the department advised that "Because of their respective commitments to Operation DESERT SHIELD, DoD...found it increasingly difficult to provide the level of activity this exercise [the NDMS drill] deserves and is necessary to support its successful conclusion." The letter in particular noted that Defense already has "cancelled or delayed a number of annual war games, open houses, and community relations programs, in order to meet mission requirements in the Middle East."

One role of DoD was to support communications via Military Affiliate Radio System (MARS) stations; this work now will be carried out on normal Amateur Radio frequencies.

The drill is based on an "earthquake" along the New Madrid Faultline in the Central Mississippi Valley. ARRL section managers will receive more information in the next Section Manager's Letter from Headquarters.

FCC ADOPTS WARC NOTICE

The Federal Communications Commisssion on Sept. 19 adopted its second Notice of Inquiry in preparation for the 1992 World Administrative Radio Conference. The text of the 150-page NOI (in General Docket 80-554) has not yet been released, but it is said to contain specific recommended U.S. proposals for WARC-92. Responding to the Second NOI will be the best opportunity for the general public to express its views on WARC-92 matters, but the time for comments will be very short.

ARRL continues to participate in the development of the U.S. WARC-92 position through the FCC Industry Advisory Committee and CCIR. The Industry Advisory Committee met Sept. 14 in Washington to hear status reports from its five Working Groups. Key WARC-92 issues include expansion of high-frequency broadcasting, low-earth-orbit mobile satellites, satellite and terrestrial digital sound broadcasting, future land mobile systems, and high-definition television by satellite.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 2 of 4

ANNOUNCING THE WORLD RADIOSPORT FEDERATION

Group's Goal is Amateur Radio at the Olympics

Amateur Radio will be an Olympic Games event if an ambitious proposal by a small group of hams becomes reality. Spurred on by the success of the World

RadioSport Team Championship (October QST, page 43), a plan to form a World RadioSport Federation has been announced by an international group of amateurs.

The WRSF is targetting the 1996 Summer Olympics, which will be held in Atlanta, GA.

The International Olympic Committee has four main ground rules which a sport must meet to be considered for the Games:

* The sport must be actively practiced in 50 countries by men and by women in 35 countries;

* There must be a sanctioning organization acceptable to the IOC;

* Periodic regional events must take place between Olympic Games;

* There should be a mechanism to establish a world championship.

The WRSF would meet these criteria by establishing an international consortium of radio societies, local radio clubs, individuals, and corporate supporters. But beyond the immediate goal of the Olympics, the Federation would seek the general betterment of Amateur Radio around the world.

In their Proposal for Discussion, the organizers note Amateur Radio's recognized value as a pool of trained operators able to provide a variety of communications services. They cite a perceived "public image crisis" for Amateur Radio, "resulting from ineffective, inadequate, or nonexistent efforts devoted to self promotion."

The WRSF believes that radiosport events (such as the team championship in Seattle) and associated educational efforts can be used as a vehicle both for promoting Amateur Radio and for recruiting new hams.

Radiosport events can demonstrate to government officials and the general public the purpose and value of Amateur Radio, the proposal says. The argument is bolstered by noting that recent international operating events (DX contests) attract upwards of 40,000 amateurs worldwide--a pool of potential WRSF members and ambassadors.

The not-for-profit WRSF would support the activities of the International Amateur Radio Union; "activities and initiatives undertaken by the WRSF are intended to enhance accomplishment of IARU goals and objectives," the proposal says. The purposes and objectives of the WRSF are to:

* Encourage the growth of Amateur Radio by promoting and supporting operating activities which enable successful recruitment of new participants, especially young people;

* Enhance individual operator knowledge and skill in emergency communications techniques and procedures;

* Provide an international sanctioning organization for on- site and other

radiosport events;

* Promote increased awareness and understanding of the Amateur Radio service among government officials and members of the general public.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 3 of 4

ANNOUNCING THE WORLD RADIOSPORT FEDERATION

(Continued from Preceding Part)

WRSF membership would fall under four categories, and the planners have estimated the following makeup: Voting members (total of 15); Associate (50); Sustaining (1,500); and Corporate Sponsors (10). A geographically diverse board of trustees would be elected by and from the voting membership, while a slate of corporate officers would be elected annually by the board. Six working committees would handle specific activities.

The promoters acknowledge that initially members would come from the ranks of contest operators and DXers around the world. They anticipate support from "more traditional" hams over the long term.

The WRSF would be financially independent of all other Amateur Radio organizations. Funding would come from initiation fees and membership dues, as well as from corporate sponsors. The promoters see an eventual annual budget in the range $175,000 to $250,000.

The federation would assist local groups in conducting competitive activities--with the inherent spin-offs of public relations and education--by promoting the following kinds of events:

* Mini HF Field Days. Two-person teams would construct and operate stations under simulated emergency conditions. Local winners would qualify for national, regional or international on-site competitions that would be staged during international contests such as ARRL Field Day and the IARU HF World Championship. International on-site events would be held at least every four years, concurrent with the Olympic Games.

* Amateur Radio Direction Finding. Long popular in Eastern Europe, the USSR, and Asia, these events would pit contestants in various age groups in a test of both physical stamina and radio technique. ARDF would permit amateurs not proficient in Morse code to be competitive.

* Communications Accuracy Contest. These traditional CW and voice pile-up copying contests would be sanctioned for holding at hamfests and radio club meetings.

WRSF would establish rules and guidelines for all the events mentioned above, and would help finance regional and international events.

The federation would maintain an international speakers bureau, to speak and to conduct workshops and seminars explaining and promoting Amateur Radio. In time, it would seek to establish a scholarship program, and to maintain a fund to aid developing countries in conducting Amateur Radio events and demonstrations. Young people would especially be targetted, through such international groups as the Scouts and the YWCA and YMCA.

The WRSF promoters believe it likely that neither national radio societies nor the IARU have the resources necessary to address, on a worldwide scale, the issues of recruitment of new amateurs and of communications training. The WRSF will seek "appropriate recognition and endorsement by the IARU," believing that "successful achievement of WRSF goals and objectives is closely tied to receipt of official recognition and moral support from the IARU and its member societies."

In the next few months, the organizers will tend to such matters as legal incorporation, election of an initial slate of trustees and officers, the establishment of committee chairmen, and obtaining essential business equipment. Then planning of a detailed agenda will begin.

The founders and supporters of the idea hope to hold a worldwide teleconference within the next 30 days, according to John Crovelli, W2GD. Among the founders are Martti Laine, OH2BH, ARRL New England Division director Tom Frenaye, K1KI, Northern California DX Foundation President Rusty Epps, W6OAT, and Boris Stepanov, UW3AX, deputy editor of *Radio* magazine.

Persons interested in this ambitious endeavor may contact John Crovelli, W2GD, 200 Woolf Road, Milford NJ 08848, for a copy of the 21-page Proposal for Discussion. A large SASE with four units of first class postage would be appreciated.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 4 of 4

BRIEFS

Space Shuttle STS-35 bearing the SAREX experimental Amateur Radio package was postponed again Sept. 18 and it now appears the flight will not be rescheduled earlier than November, as other waiting Shuttle flights have priority over the scientific mission of STS-35.

* Postal rates probably will rise around February, 1991, sources say. While first class letter rates would rise from 25 to 30 cents/oz., the impact on second class mail publications such as QST would be much greater--31 percent. At current membership levels mailing costs for *QST* could increase some $88,000 per year. By using the "printer's newsstand/postal pool" and mailing from several points around the country the League could save about one-quarter of this amount (QST is printed in Glasgow, KY). International rates also probably will rise (QST has some 10,000 non-U.S. subscribers/members, including Canada). International rates can be--and often are--changed with as little as one month's notice.

* FCC has issued a public notice regarding unlicensed devices transmitting in the 900 MHz range, particularly video transmission systems. These systems ordinarily use a wireless receiver and transmitter for remoting video devices such as VCRs, video cameras, and games, as well as television

pictures and audio. Such devices fall under "additional unlicensed use" of frequencies and as such have no protection from interference from Amateurs or any other licensed service.

Companies which have received FCC grants of equipment authorization for their video transmission systems include: Gemini Industries, Recoton Corp., Star Tech Company, Video Technology Engineering, and Wiso Electronics. Grants of equipment authorization issued by the FCC appear monthly in a public notice entitled Certification/Notification Actions. Customers experiencing RFI to such devices should contact the manufacturer.

* The ARRL Volunteer Examiner Coordinator staff is processing about one Morse code waiver upgrade package per day for disabled applicants.

VE statistics for June and July (the most recent months available) include 8435 exam elements administered in June (4075 by ARRL VEC), and 7617 in July (3098 ARRL). 2640 applicants were served by ARRL VEC in June, 1853 in July.

* ARRL's East Coast Educational Workshop hosted 55 people in Gaithersburg, MD on Sept. 8, many of them newly licensed or unlicensed teachers interested in introducing Amateur Radio to their classes. The League was represented by Educational Activities Coordinator Rosalie White, WA1STO.

* Between now and Oct. 1 ballots for division director and vice director elections will be mailed to ARRL full members in the Central, Hudson, Northwestern, Rocky Mountain, and West Gulf Divisions. In each of those divisions, there is more than one candidate for one of the two offices. The ARRL Election Committee has declared the following, as the only eligible candidate, elected for the 1991-92 term:

Director, Central Division: Edmond A. Metzger, W9PRN;
Vice Director, Hudson Division: Paul Vydareny, WB2VUK;
Director, New England Division: Tom Frenaye, K1KI;
Vice Director, New England Division: William Burden, WB1BRE;
Vice Director, Northwestern Division: Mary Lou Brown, NM7N;
Director, Roanoke Division: John C. Kanode, N4MM;
Vice Director, Roanoke Division: James G. Walker, WD4HLZ;
Director, Rocky Mountain Division: Marshall Quiat, AG0X;
Director, Southwestern Division: Fried Heyn, WA6WZO;
Vice Director, Southwestern Division: Wayne Overbeck, N6NB;
Vice Director, West Gulf Division: Sam Sitton, KV5X

* The ARRL Letter often relies on readers for news tips. When you see or hear something of interest please send it to ARRL HQ, or give us a call.

* CORRECTION: The last issue of *The ARRL Letter* was Volume 9, Number 18.

>NECESSARY to have CW tests; that's a little more to the point.

You didn't quote the line in the original that prompted the flame which
intimated that the no code issue was a bunch of #$%#. I practiced bloody
fingered guitar for years, but while I could make the notes, I could never
make music. It took a year of struggle at age 14 for me to get an amateur
license solely due to the code requirement. In a related vein, I painfully
used CW for years on the traffic nets (old call WA4VJZ), but never managed
to beat 18 wpm. I believe that CW is like music in that some people find it
easy and others find it nearly impossible. To make it difficult or impossible
for people with no musical talent to become amateurs while letting in those
who naturally find CW easy is blatently unfair. And then to blithely
dismiss the problem as "not a difficult requirement" really sets me off.

Take a look at Part 15 regulations in the FCC rules. Max power 100 milliwatts,
limits on antenna size, and noninterference requirements.

Gary

Is anyone here aware of an IBM-PC plug-in card that does
   frequency synthesis from dc-3Mhz in 1Khz steps. I need
   something with a 50-Ohm output, with reasonably good
   phase-noise characteristics. Oh, yeah, it's got to be
   cheap ;-)

I give up... how does the FM circuit decode AM on 108-140... and
how do you select between AM and FM on the 138-140 overlap?
Does it really receive 310-370 or just indicate it?
Is 310-370 still in the military AM Aircraft band?

Yes, I am still looking for the TX mod for an ICOM-2SAT.
Email and I will summarize to the net, or post.

Thanks,

According to the Wall St. Journal, Monday, 1 Oct, p. A7, column 2:

"Another candidate for the luxury tax discussed that would have hit
many Americans -- a 10% levy on electronics equipment with price tags
over $100 -- was apparently dropped from the final package."

This is not to say that you shouldn't lobby your congressperson to
prevent them from putting it back it. However, at the moment, it is
not part of the package.

Well let me set the record straight. I went from novice to General then took
the Advanced years latter. I copied the letters I recognized and dot dashed
the ones that gave me a mental block. This trick kept me from falling too
far behind and losing the context altogether. By the way, if you mark the
dots and dashes vertically instead of horizontally, it's much faster.

>The survey:
>
>1. What is your favorite single-band (2M) HT and why?

Icom IC2. Rugged and reasonably priced.

>2. What features do you think are important in a 2M HT? (e.g., obviously DTMF,
>   but what about # channels, sub-audible encode/decode, clock, etc.?)

Thumbwheels to set the frequency (work in the dark, simple, rugged) and a PL encoder. The rest is fluff. If you must make phone calls, buy a cellular phone.

>3. What antenna's do you recommend for it and why?

It comes with a duck. If you need more range, buy a mobile rig.

>4. What batteries do you recommend for it and why?

The biggest available. In the case of the IC2 thats a BP8. You need the extra mass when you use the radio to club a mugger.

>5. Are there any other accessories you recommend?

A rapid charger and spare batteries are musts.

>6. Is there any dealer you would recommend or not recommend?

Go with the one that has it in stock at the lowest price. Dealer service is mostly a joke anyway. Icom America has good factory service centers.

Naturally my requirements may differ from yours.

Well folks...it finally happened!

The new Canadian amateur radio framework took effect today.

I am one of those who was grandfathered to the highest level so can now work

HF phone. Canada has completely revamped the system so that entry level is
actually NO CODE (please let's not hear the CODE vs. NO CODE arguments
again).
It will be interested to see what effect it has on the bands.

Just laid in a Kenwood TH-75A 144/440 MHz handy-talky, and I have a couple of questions for the net types.

1) Is there any way to clear a memory location (i.e. restore it to "unset" status) short of re-initializing the microprocessor and dumping all the memories at once? It matters when there is something loaded into memories 8 and 9 since they control the "programmable" band scan. You can't do a full scan unless they're empty. How do you empty them out?

2) Anybody got any nice handy undocumented power-up sequences or internal mods?

REVIEW:

The Kenwood TH-75A is a nice hefty piece of equipment that will run 2 watts on the supplied battery (7.2 volts) or 5 watts if you shove in a huge battery or run it off your car. As usual there are five or six different kinds of batteries you can shove onto the thing.

ADVANTAGES: The display is easy to read. Some displays have severe shadow effects if illuminated from the side - not this one. The buttons are widely spaced and easy to use for the fat-fingered. Some units have larger buttons, much more closely spaced. It's difficult to avoid pressing two buttons at once on those. The built-in audio is of excellent quality, as the speaker is larger than most on the market. The unit supports scanning both bands at once, and can work fully cross-band, listening on one while transmitting on the other. The manual has been written by a native English speaker; no "Japenglish" to be decyphered. The rubber duck antenna is a thin-whip type giving excellent coverage. "At 2.2 liters it's good only for hand-to-hand combat..." Well, not exactly, but you can sure club a mugger with this baby. It looks like it would be none the worse for wear, either. It's built like a tank.

DISADVANTAGES: There are almost too many features. This radio takes about three hours to learn how to drive, and there are some features which aren't explained in the manual...you just have to crash around, causing interference etc., until you figure out just what the heck is going on in there. There seems to be no way to clear a memory location to "unset" status, which is actually a desirable thing to want to do - see question (1) above. There is no memory for autopatch phone numbers, a feature some other units have - very handy while driving not to have to punch in a whole phone number. While the manual is clear, some things in it are not. (Example: turning on CTCSS for receive also turns it on for transmit, though there is a separate button for doing this. This isn't documented - nor does the tone-encoded transmit indicator come on in the display. It makes sense in retrospect but it's puzzling as hell when you're trying to figure out why a given repeater sometimes hears you and sometimes doesn't.) The actual effect of the "battery save" function isn't explained, either. It doesn't turn off the display - that's "Auto Power Off." There are more things like this.

WEIRDNESS: At the touch of a button the whole thing turns into a pager, and turns off almost all its other functions in so doing.

UPSHOT: Seems like a good unit, at the bottom of the price range for dual-banders. Mine cost $440 at Ham Radio Outlet.

Mine transmits a few milliwatts in the area of about 37 MHz. The receive beeper (the "pager") transmits around 27MHz.

>I being steered to a higher margin device?

As much as I admire Icom equipment, you were being had! My FT470 suffers from some intermod in downtown Atlanta, but so does my Icom and in the same places and in about the same amount. ALL of the wide receive coverage HTs suffer from out of band intermod to some extent. The FT470 got a bad rep because it's first IF falls in such a way that the National Weather Service frequency image falls on a popular 146 Mhz repeater frequency. Yaesu will shift the IF for you at no charge if this is a problem in your area. Because HTs normally work with such a poor antenna (ducky), they are made to be very sensitive. So wide receive coverage and high sensitivity add up to intermod problems when you hook any of the newer HTs to a good antenna.

You can avoid overloading your HT with out of band signals by putting a cavity in the line to your outside antenna (highly recomended), or you can buy an HT that doesn't have wide receive coverage such as the IC2 from Icom, or you can buy a base rig for use with outside antennas.

HTs are nice, but like multimode packet/rtty/amtor/fax boxes, they are a compromise. A dedicated radio for a dedicated purpose will be superior to a radio that you attempt to force to be everything to everybody.

The salesman may have fallen prey to the rumour mill and may honestly have thought he was giving you good advice. The margins are slim on Icom as well as Yaesu. If, on the other hand, he had tried to steer you toward a Kenwood, well then he was trying to get his hand in your pocket.

I am concerned that you choose to delete the line in your post with the cute little #$%#$ curse symbols in it that triggered my flame. You were clearly displaying an attitude that said *I* did it so it's easy for everyone. It's not. I felt that I had to respond to a posting that viewed the world through such narrow personal blinders.

> You, on the other hand, displayed a true lack of 'brotherhood' in the

>learning the code for the ham radio tests.

I knew it. I have contended for a long time that musical talent and CW skill go hand in hand. Every high speed CW op that I have discussed this with has admitted to being musical. Most of the folks who have trouble with CW admit they can't carry a tune in a bucket. Personally, I wasted several years of bloody fingered practice trying to master the guitar. I could technically sound the notes perfectly, but I could never make music. Similarly, I spent a year of very hard work building enough code speed to pass the exam, but I still get a mental block at times even on the simplest letters, even E. I found that writing the dots and dashes down at such times allowed me to continue copying without getting hopelessly behind. You don't seem able to understand this. Because it's "easy" for you, I must not be "HONESTLY" trying hard enough. Please also consider that Samuel Morse's original telegraph made marks on a strip of paper that were later deciphered by the operator. This is the way old Sam intended the Morse Code to be used. I don't consider it cheating to use his methods. Copying the message correctly is what it's all about after all, not showing off a musical talent.

> Gary, I do hope that you can learn to further the efforts of ham radio
>operators in a more respected manner than what you are displaying. It is
>a worthy hobby of talented and willing individuals. Perhaps one of the
>reason the code requirement exists is to keep out people who will be a
>detriment to the radio community as a whole. (I bring to mind the recent
>20 meter wars, and also leave you to think of the deplorable condition of
>11 meters.)

I hope you will learn that your view of the world is not the only view. I hope you will learn that there are other people in the world who don't have your musical gift, but have other fine talents that can contribute to the betterment of Amateur radio if the artificial barrier of the CW exam is removed. And I can't resist pointing out that the 20 meter warriors all passed a CW exam.

I admire people who can make beautiful music, on a guitar or on CW, but it takes more than effort to make music, it also takes talent. That's something a person is born with and, like the color of his skin, something he can't change no matter how hard he tries.

Today is a very sad day in the life of the died in the wool news junkie and RTTY monitor:

TERMINATION OF RTT TRANSMISSIONS OF FILE TO AR
(TO CEASE SEPT. 30, END OF ERA) (120)

EFFECTIVE SEPT. 30, TRANSMISSION OF THE WIRELESS FILE TO AR POSTS VIA RADIO TELETYPE (RTT) WILL CEASE. THE CONVERSION TO HIGH SPEED MODEMS AND SATELLITE TRANSMISSION OF THE FILE IS NOW A REALITY IN AR -- AND DOUBTLES AN IMPROVEMENT -- AND IT SIGNALS THE END OF ONE ERA AND THE BEGINNING OF ANOTHER. FOR THOSE WHO REMEMBER "GARBLE CHARTS" AND THE EFFECTS OF SUN SPOTS, P/PFL WOULD LIKE TO PROPOSE A MOMENT'S REFLECTION ON OCT. 1 ON THE FILA'S MORE THAN 50 YEARS OF SERICE -- VIA RTT.

(PRECEDING FS MATERIAL NOT FOR PUBLICATION)
NNNN
28/21:16 GMT

Tuned today to the formerly STRONG perfect VOA freq, thinking the above was some kind of bad dream or mistake.

Nope. Just like with AFRTS, another source of NEWS is gone. The 14637 feed was about 200K a day. Here at Great White North, we used it as a source for the "official line" and government opinion. In the past few weeks, we found the phrase "NEW WORLD ORDER" in the feed many many times. Even more than one has been hearing it on conventional media.

We feel let down and depressed up here. As I type it is raining slush on a cold grey MONDAY afternoon.

Such is progress.

```

I have a Grove "Power Ant III" antenna pre-amp that I'd like to sell. It has a max gain of 30dB and the gain is continuous (as appossed to a switch where you select a specific gain like 5dB, 10dB,...). It uses type F connectors (one for antenna input and two receiver outputs) and it comes with an AC wall adaptor. Dimensions are: 4"Wx2"Hx3"D. The preamp also comes with two coax leads to the receiver(s) with the following connectors: PL-259, 1/8" mini-jack (for portables), and a BNC connector (for scanners).

To summarize, here is what's included:

Grove Preamp
AC wall adapter
Two coax leads (about 2 feet in length, F connectors at both ends)

One F to PL-259 connector
One F to 1/8" mini-jack connector
One F to BNC connector

List price is $79.95 (for the preamp) plus 12.95 (for the cables and
connectors). I'll sell it to the best offer. Oh, I'm selling the preamp
because my newest radio (an ICOM R70) has a built-in preamp which works
quite well so I no longer need the Grove preamp.

If someone (whether volunteer or not) decides that they will arrogate to
themselves the authority to determine which code-copying techniques are
"acceptable" and which are not, a judgement which is completely outside
the authority given to him by the FCC, and for that reason decides to
disqualify a given applicant - that's called "abuse of authority".

If you don't follow the rules you're given, and damage someone else as a result, you're likely to be sued. I wouldn't have it any other way.

Yes - but make sure that it's an emergency as defined in FCC rules. If the "injury" is a simple broken arm (i.e., non-life-threatening), the use.

Having asked folks in the State of California about it (and getting incredulous responses like "you can really do that?", here's what they suggested:

First, DO NOT try to use the normal procedure of the agency you're trying to talk to. You want your transmission to be absolutely distinguishable from normal traffic. For example, the CHP dispatch center in this area has the tac call sign of "Santa Ana" - to get their attention and report an emergency under this method, I would probably say "Highway Patrol dispatch, this is amateur radio station N6BMO with emergency traffic."

That's the second one - make sure the words "emergency traffic" are in there somewhere. After that, just talk to them.

>I would followup any such use of the radio with a written report to the
>appropriate authorities so they would know exactly "what, when, and why"
>of the incident. Only after that will I be able to REALLY find out how
>they react to such use of their radio frequency.

Make sure that one of these "appropriate authorities" is the FCC Engineer-in-charge of your area - this falls under his purview, and the person who gets the story in first generally has the best chance of keeping his license :-).

This way they never had to worry about the BARF net moving on frequency, telling them that they were in violation of regulations for handling communications that by their signifigance, are only legal on public networks for hire!

Satcoms allowed them to keep the ham bands for approved hammy type pursuits, while the nuts and bolts type comms were via Telex.

|>--

I used to install these things for a local hospital. You're correct on
the transmitter.
I don't have any idea what freqency range they use, but they are keyed
either by freq.
or by some code to a particular receiver. There were several different
ones, and if
you had two subscribers next door to each other, you would put in two
different codes.

The boxes automatically call the monitoring service, either local or a
national one in
a different state. There is a data transmission which identifies the
box to the service.
They have a file, made out on subscription, on each box which identifies
the person,
medical conditions, responding agencies, etc. The service always calls
the house first
to check for false alarms. If no answer, they call a predesignated call
list starting
with a neighbor, etc. on down to the police or ambulance. The boxes
also have a timer,
which can be disabled. If the timer is not reset every 12/24 hours, the
box calls the
service and informs them of that, in case the person could not signal
himself. It also
automatically calls on low battery condition of the large battery
backup.   Pretty good
little system, actually, but not cheap. The ones I put in were
subsidized by the hospital
and cost the subscribers $20/mo.

  Help! Ive fallen and I can't get up.....

  Immmm, Immmmmm having chest pains......

  My guess is that the transmitter carried by the person only has to reach
  a local transcever (in their home) that is tied into the phone line. This
  in turn dials a local alarm company that then calls the family and proper
  emergency people. Of course ive never seen one and this only my guess so
  the ususal money back offer is invalid :-)

I don't know if there is a pre-recorded message or not. There would have
to be if there is not easy way to identify the phone number. It does open
a room speaker to the phone line.

The remote control I saw uses and audio tone pair to activate the system.
It looked quite cheap to me.

The increase was announced well in advance. If you didn't know about it before your renewal came up and you don't know how the money is used, then you probably *are* wasting your money sending in a renewal, since all you did was pay dues -- you never allowed yourself to be a member. The "L" stands for "league -- an association or alliance of persons for common action.", The dues is not some award you are granting to the league -- it's a payment partly to pay your cost to the organization (QST) and partly to help advance its goals. The League needs the money, but you're not really a member unless you're involved. The very least involvement is reading the magazine, and that was where the increase was announced.

If you really want to know what's being done with it, the audited financial statements of ARRL for 1989 start on page 56 of the May, 1990 issue of QST. I also suggest reading the article on page 18 of March, 1990 QST.

Considering that the last dues increase was in 1981, I think we've done a pretty good job of holding the line on expenses. But you'll have to decide for yourself whether the services available from ARRL, plus the contents of QST, plus the opportunity to help protect and defend the Amateur Service are worth $30/year to you.

**** UoSAT-OSCAR-11 BULLETIN   30 September 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UO-11

Suggestions on the most useful operating schedule for UoSAT-2 should be sent to UoSAT as soon as possible so that they can be taken into account during an operations review due to take place later this month.

** FO-20

FO-20 is continuing to experience high temperature problems (due to the spacecraft experiencing no eclipse periods during which it can cool down) which is forcing a drastic reduction of operations. As of the weekend of 29 Sept 90, the battery temperature had risen to near 45 degrees C. Extended exposure to high battery temperature will decrease the useful life of the battery.

From		To		Mode
011090	0900	021090	0910	PSK Telemetry acquisition
041090	0955	041090	2330	JA
081090	0920	081090	1110	JA and JD
111090	0825	121090	0850	JD

The above dates and time are in UTC and the schedule may change without notice. The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

** MIR

A new and exciting amateur radio project is being planned for the Mir space station known as the "Amateur Radio Experiment on Mir" or AREM. This project is the result of a collaboration between the Soviet Union and the Austrian Amateur Radio Society (OeVSV). It is designed to provide equipment for both 2M packet data and voice transmissions from Mir. The voice messages will be spoken in German, Russian, and English and will alternate with packet transmissions. The first AREM operations are expected to begin around January 1991 when an Austrian cosmonaut will install the station after he joins the crew of the Mir. To obtain further information about AREM, please write to:

Wolf Hoeller (OE7FTJ)
Amraserstrasse 19
A-6020 Innsbruck
Austria

** AO-13

The present transponder schedule for AO-13 is as follows:

Mode-B   : MA 003 to MA 165
Mode-JL   : MA 165 to MA 195
Mode-B   : MA 195 to MA 240
Off   : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas   : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

** AO-10

Until further notice please DO NOT use AO-10's transponder.

** BADR-1

Would any stations receiving signals from the BADR-1 spacecraft on 145.825 MHz and 144.010 MHz please send brief details to UoSAT - thank you.

Thanks to AMSAT-NA ANS and its contributors for much of the above information, there is generally insufficient 'room' in the UO-11 Bulletin to give regular acknowledgements.

** $BID **

Please use BID $UOSAT.930 for PR BBS use.

```

I just got my OSCAR-13 satellite system all up and running and wow is it a blast! My first contact was with a FINLAND station (OH5LK) and I made 6 more with various US stations.

Although I could copy most of the stations it was not easy (I do not have a preamp for either 70cm or 2M). So I would like to get information about preamps that are available and the only one that I know about is the Landwehr preamps that Henry radio sells. I am looking for a preamp that has RF switching in it and can handle greater than 100 watts (currently run 30 watts but I don't want to fry a expensive PREAMP)..

So If you know of a good vendor please send to me their name, FAX number, phone number, or address so that I can get the info!

Thanks in advance!

Phil

>
> Thumbwheels to set the frequency (work in the dark, simple, rugged) and a
> PL encoder. The rest is fluff. If you must make phone calls, buy a cellular
> phone.

They may WORK in the dark, but so do LCD's. You just can't see either one. Fortunately the LCD rigs usually come with a builtin light. With the IC-2, you have to fumble for a light if you don't know what the current setting is. I have IC-3AT, IC-4AT, IC-2GAT, and IC-32AT so I know how they work.

> >3. What antenna's do you recommend for it and why?
>
> It comes with a duck. If you need more range, buy a mobile rig.

The AEA 1/2 wave (not a 5/8 wave) give very good extended range. The improvement over a duck is more than going from low to high power. Couple that with high power and you can approach what a mobile can do in those circumstances where a mobile rig isn't practical (such as pedestrian mobile). The mobile rig with a properly installed antenna certainly will do much better, but the half wave whip is a good idea. Larsen also makes them.

> >4. What batteries do you recommend for it and why?
>
> The biggest available. In the case of the IC2 thats a BP8. You need the
> extra mass when you use the radio to club a mugger.

There are bigger available. They last longer (1200mah), are an inch longer, and have more mass. I have 4 of them. I've never tried them on muggers yet. The 1200mah gives me 2 days of continous receive-only operation WITHOUT the power saver. If you have the power saver ON, and turn the radio off when you know you are not listening, they could last a week or more for no transmit activity. The 800mah BP-8's, however, might well give you all the capacity you need. If I was going to do it all over again, I might well go with the BP-8's instead. I cycle each pack through one day of service, one day of full slow discharge, and two days of slow charging.

> >5. Are there any other accessories you recommend?
>
> A rapid charger and spare batteries are musts.

If you have enough spare batteries, you won't need a rapid charger. I don't even own one.

The alkaline packs are really a good idea since you can plop in some alkalines bought just about anywhere. I'd recommend the 8 cell variety if you get the newer radios that can handle 12 volts. Icom makes 6 and 10 cell versions. Most alkaline cells are sold in packs of 2, 4, and 8. Never mix alkalines of difference level of usage.

> >6. Is there any dealer you would recommend or not recommend?
>
> Go with the one that has it in stock at the lowest price. Dealer service
> is mostly a joke anyway. Icom America has good factory service centers.

Also consider a more local dealer if they meet your needs. You can get faster shipment at cheaper rates that way, as well as it being pratical to go "drop in" on them in person if you need to. I live in Urbana IL and usually buy from AES in Milwaukee, Ham Station in Evansville IN, Universal in Columbus OH, or R&L in HAMilton OH (R&L's emphasis).
I usually see second day delivery from regular UPS shipments, except

from AES I typically get next day from regular UPS shipments.

> Naturally my requirements may differ from yours.

Of course, everyone's requirements and needs are all different. The best thing to do is think carefully about what yours are. If you still don't figure out what is the best to buy or do, posting the specific needs might get some better suggestions.

I've been using some orange ethernet wire (Mowhawk 5713) and it appears to be better built than any RG/8 that I've seen. It's double braid shielded with two layers of foil and some type of foam dielectric (teflon?) with a solid #12 center conductor. I've been getting great results on HF but have not yet tried it with VHF or higher. I've run about 70 feet of it outside, sheathed in an old garden hose and buried in the gravel out to a Butternut vertical. I'm still looking for a Mowhawk catalog for the specs to be sure.

73's,

I just saw one of those TV comercials for a device that "old folks" can carry with them that has a panic button on it.

When the button is pressed, it somehow gets a message to the local ambulance.

How do these things work?

My guess would be that the device is a low power 300Mhz transmitter
(like wireless burgular alarms or newer car alarm control boxes).
A receiver would then be connected to a telephone auto-calling device
which phones the ambulance and plays a pre-recorded message asking for
help.

Greetings to everyone on the net. I have the following gear for sale (or swap)...please drop me E-Mail at GRAY_S@DICKINSN.BITNET or call me at (717) 258-5477 if you have any questions/comments/wanna deal.

Drake T-4XC (sn 27721), R-4C (sn 25595), AC4 (32792). They are in perfect condition, recently back from a complete factory overhaul. I have put them on the air only long enough to ensure that they are in 100% top notch condition; everything works great and the TX4C puts out 150 watts without effort. The only options that I have for the Drakes are extra 10 meter crystals, but the price includes Drake boxes, manuals, *and* Drake invoices from the work done this summer. The price on the Drake C-Line is $450, -or- I am interested in making a swap for an HF transceiver in equally excellent condition.

MFJ-949D Versa Tuner II (with PEP metering). Mint condition - price: $115

MFJ-931 RF Ground. In mint condition as well - price: $45

Cushcraft AR-2 FM Ringo. Never outside - price $20.

Cushcraft ARX-2B Ringo Ranger II. Excellent condition - price $30.

73,
Steve Gray

I use my Yaesu FT-470 connected to a Ringo Ranger II through an amp/preamp
and have no problems using it on packet. I think the salesman wanted to
sell you something else (personal favorite, larger markup?). I do get
some intermod once in a while, but no more than I did with the ICOM IC-32AT
I had before. The 470 is a good little radio for the money IMHO.

I don't normally read rec.ham-radio, just rec.ham-radio.packet... but a friend
pointed me here since my name was mentioned...

>> He said the most popular license in Japan is what he called
>> "Novice Radiotelephone", which has no code requirement, but a significant
>> theory exam
>
>   He was right. I have mentioned this before on this forum. The
>Japanese have a no-code HF licence. The power is limited and this is
>the key.

Yup. It's interesting to note that the Japanese attitude seems to be "see how
we can do something good without completely breaking the rules", instead of

"oh, but someone might construe that as wrong so we better not do it"... not a bad comment on the two cultures, in general... ?

>   Bdale who I am told speaks Japanese and has visited those Islands
>could possibly enlighten us further.

Actually, I don't speak very much Japanese... just enough to get in deep trouble trying to order dinner! But, I've been to Japan twice, both very pleasant and informative trips, and I continue to talk to my Japanese friends via email quite regularly... it was fascinating on my last trip to see how many young (college age or so) people were *active* in ham radio, and to see how many unexplored corners of packet were being investigated...

Wish we had that level of interest and enthusiasm in this country... [sigh].

I recently purchased a Cushcraft R5 vertical. Since there has been interest from time to time about limited space antennas and the R5 in particular, I thought I would share my experience with the R5 so far.

Why did I buy the R5? I live in your typical suburban subdivision where the houses are relatively close together and the lots are small. While towers and beams are not expressly forbidden, I have never seriously considered putting up much steel and aluminum. My operating is casual and my favorite activity is DX chasing. I can almost hear the peals of laughter throughout the net: "that poor fool, ya just *can't* work DX with a vertical!!" Well, read on.

First, I have been chasing DX for several years and I have *always* used a vertical. My DXCC total (worked) stands at 210. I know it would be considerably higher if I spent more time on the air and I followed the DX bulletins religiously. But I am not a fanatic about it. The point is, my station can do the job.

My previous antennas were a Hustler 4BTV (40/20/15/10 quarter wave vertical) at my previous QTH, and a Cushcraft R3 (20/15/10 m half wave) at my present QTH. The 4BTV was mounted on the chimney of my two story house and had resonant radials arrayed around the roof. It worked fine. At my new QTH the roof geometry did not allow the radials, so I went with the R3 (this was 1985) which does not require radials (nor does the R5).

The R3 was also mounted on the chimney and was about 30 feet above the ground. I had several problems with the R3, however. The R3 had a base mounted motor driven tuning capacitor which was controlled from the shack. Once in the middle of winter the control cable opened up. So much for operating (except on one frequency) 'til spring. Then recently, some sort of intermittent problem occured. I suspected the coax and connectors but replacing them did not fix it. I suspect now it is a flaky trap. When it worked, however, the R3 did a good job. I could generally work anything I could hear. A pile-up sometimes needed the KW afterburner, but usually I stuck with 100w out.

So...needing a relacement for the R3 and being generally satisfied with its performance, I popped for a new R5 (about $270).

The R5 is a 20/17/15/12/10 meter half-wave vertical, adding two more bands over the older R3. It uses factory tuned trap sections to resonant the antenna on the different bands. Because of the inductance of the traps the overall length (height) of the R5 is somewhat less than the R3. The most significant difference, however, is that the R5 uses a broadband passive impedance matching system which eliminates the motor driven tuning capacitor. No more worries about control cables. To make this work, however, the R5 needs four 48 inch stainless steel radials at the base and a capacitance "hat" just below the first trap. So instead of a staight "stick," the R5 has these things sticking out, which can complicate getting it to its final mounting place (the chimney on the roof in my case). More on this below.

The assembly is easy and quick, aided by an excellent set of instructions. I first put it together on my deck and propped it up for tests. Surrounded by trees and 12 feet from the aluminum siding of the house, the SWR on the various bands did not look like the curves given in the instructions. But I didn't expect it to be so. High and clear is the rule for this type of vertical. Even from the deck, several 20m European and USSR contacts were easy with 100 watts (my QTH is near Chicago).

The next day was time to put it "high and clear" on the roof. To do this I took off the base radials and the capacitance hat and broke the antenna into two sections. The antenna is very light (8 lbs), but it is too easy to damage the radials and hat in the process of carrying it up to the roof. I reassembled everything up there and clamped it to the chimney mount. The coax connection was thoroughly sealed with "Coax Seal." I did not use and do not recommend the connector boot and silicone grease supplied with the antenna.

Back in the shack the SWR looked very similar, though not identical, to the "typical" curves in the instructions. But even so, the R5 appears to live up to its advertising as being less than 2:1 over most of its five band range. Excellent! In my favorite sections of the bands, it is 1.5:1 or less.

So, does it work DX? You bet. With only 100 watts, I was again able to work anything I could hear, and I could tell the others on the bands were not hearing anything I couldn't! Over two evenings I worked 20m Europe, USSR, and Middle East stations. One nice surprise was having a 4S7 come back to my first call one morning via long path while other North American stations called in vain (had their beams pointed the wrong way I suspect). No KW needed so far.

Overall, the R5 seems to be an excellent antenna and well-engineered. It fits my needs, operating style, and environment very well. It is not cheap, but for me the value is there.

Needless to say (I hope), I am not connected in any way with Cushcraft. These opinions are mine alone.

Generally, the little remote controls (and the big ones for garage doors also) are around 318 MHz with a VERY weak digital "bleep" or "buzz". The

one I had was on 318 (rather wide signals) and could be heard on an
appropriate scanner RIGHT BY the unit when activated.

Oh, I'm getting so tired of hearing people tell me why I shouldn't use my radio to call the police.

I care more about saving a life, any life, than this whole hobby!
Yes, that's right. Lives mean more to me than HF, OSCAR, and RTTY DX combined. Those of you who can't understand that need read no more.

Now, if Bob's Quick Mart is across the street, I'll go there. But if noones around, I'm calling. I'll bet it's illegal to cross the interstate. Is that going to stop you from helping someone? It's probably illegal to flag down a car with a cell phone. Is that going to stop you? I guess all you people really concerned about this will just drive on past, maybe even stop if you can find a legal parking spot, or go home and call 911 from there. Thanks.
In the meantime, I will have stopped and if noones on 2m or around me, I'll already have contacted the police my own way. 'Nuff said.

I have a few questions. Any answers?

1) Does anyone know what the deal is with the STS-35 shuttle mission?
I'd like to get involved with the SAREX mission from the Amateur Radio
Club at my school (Northeastern University, Boston, Mass.)

2) I finally passed my Novice and Technician exams! (Four days apart from
each other). Does anyone know what the call signs being given in ITU
region 1 are at the Extra level? If I am able to go for my Extra by the
end of this year, or early next year, will I receive a 2x1/1x2 or 2x2 call?

3) Does anyone know HOW radio amateurs became known as 'Hams'? Is there
a rational reason for the term?

Thank you very much in advance for any answers you can supply.

If you reply privately, please send e-mail to: Sehrlich@lynx.northeastern.edu

I've done a lot of business with both of these companies and can highly
recommend them both. Dan at the Ham Station has been unfailingly
helpful to me over the years and I'm a hard person to please.

I use it. I can't really say I see any difference between it and RG-213.
Figures I have extrapolated from the Belden book indicate its about 1/2 db
better than RG-8. It certainly has better shielding but have fun putting
on connectors. I use a razor blade to get the inner foil off the Teflon.
No, its not near as good as CATV hardline, but have lots of fun putting
connectors on that, too. I have an article at home about building 1/4 wave
matching sections from copper tubing to convert 75 ohm CATV stuff to 50 ohms.
Its probably not worth it considering the 1.5/1 SWR match anyway. Ham Radio
magazine? I'll look it up for the interested. A concern about electrolysis
between the copper and aluminum kinda bothers me.
Of course the line loss is only worth considering at VHF freq. and above
for practical purposes.
Oh yes, Ethernet double shielded coax is 50 ohms (and stiff).

Howdy:

I had such great luck recently with the help needed message for the RTX-2000 that I thought I would try again. I need a couple of COSMAC 1802's. I could also use whatever manuals you may have such as programmers and user reference manuals. The indigenous system I have for it is a variant of FORTH (called IPS by its designer, DJ4ZC). This chip was originally done by RCA. If you have some laying around and have development tools you aren't using, let me know. The COSMAC 1802 is in the integrated housekeeping unit (IHU or OBC = on board computer) in Oscar 10 and Oscar 13 and planned for Phase III D.

Last night (9/26/90 0230 UTC) on about 14.026 I worked AS4C through a sizeable pile-up. His signal was so strong that I have some doubts that he was for real. He was 10Db over S9 at times. Does anyone know if AS4C is real, and if so a QSL route? BTW, please excuse the long disclaimer, our lawyers got carried away :-).

Thanks,
Steve

Gary Bishop asked about cleaning old capacitor gears. Well, you could use gasoline. just immerse the gearing in a small amount of gas in a coffee can or other container. This isn't the safest way, but used outside and away from sparks and flames it should be ok. A better way is to go down to your nearest auto parts place and ask for a liquid de-greaser. Do the immersion and soaking bit according to instructions on the can.

I would use any light-duty grease. The same auto parts house can probably recommend a light lubricant.

As long as we are reminiscing about old stories involving hams, does anyone remember a Comic book called Treasure Chest that was distributed by subscription thru elementary schools?? It may have been limited to parochial schools, not having attended public schools, I can't say if they got it too.

One of the stories was called "Chuck White". Chuck being the hero of the story was a guy who took time to help out the various kids in the stories. He was also a ham. One of the plots back in the mid 60s involved a bunch of the kids trapped at a ski lodge by a blizzard and the young hero (whose name I forget) uses what he learned from ham Chuck White to take a car radio (tube type, this is the 60s) and the batteries out of the cars and builds a transmitter out of it. (Yes, it was CW, but then it was the 60s.)
All in all, it was a great story. Unfortunately, I don't know of anyone who decided to become a ham after reading it.

So, are there any other OF's out there who remember it??

Just yesterday, I attended a talk by Jerry Kowolsky, the president of
CSI Technologies. They make high voltage capacitors.

Even though, I'm an EE, I never understood the difficulties of making
high voltage caps. Apparently it is quite an art. He indicated that
only about 5 companies in the world can produce 'good' ones.

His company got a letter like yours from Iraq about 2 years ago. The
rest is history.

I am looking for a CW decoder box that feeds into an
RS-232 serial line. I know that there are several
plug-in boards for PCs out there, but that is not a
viable option at this point.

I would prefer one that translates to ASCII, but I will
look at anything that doesn't require my CPU to poll a
line for transitions.

Has anyone a line on such a beast? Thanks.

>How to degrease capacitor gears?

Use a vapor degreaser if one is available.

Gunk (tm) is an amazingly effective grease-dissolving substance
available in aerosol cans in K-Mart automotive departments. STP (tm)
makes a similar product. Spray it on, then wash it off with water (!).

Caution: Don't let Gunk get on electrical components. I used it on a
car engine, and it penetrated and shorted the oil-pressure switch.

>What is good for relubricating the mechanisms?

I've used white silicone grease available at dive shops; it's intended

```
for lubricating O-rings in underwater equipment.  It doesn't dry out
like whatever they used to lubricate capacitor gears in World War II.

I've been told that the RDF equipment used by the FAA requires a steady
carrier such as provided by AM. While I'm sure that SSB would be more
difficult to DF, it would seem that an FM "dead" carrier would suffice.
I believe that the primary issues are that AM was first and the benefit
of changing over to FM is less than the cost of the changeover would
be to worldwide general aviation. There are still a lot of DC3s and even
a few Ford Trimotors in service worldwide, not to mention the thousands
of general aviation light planes and backwoods airports that would be
forced to convert from a service that works to a service that might
work a little better. Plus there is a strong feeling of "if it's not
broke, don't fix it".

>your mods may fix or improve on.

I don't have my mods docs handy but here it is from memory. The first change is to replace the LM324 opamp that simulates RS232 with a TL084. The slewrate of the original part won't reliably work above 2400 baud. Cut the trace between the baudrate switch pin 1 and U1 pin 2, add a wire from the baudrate switch pin 1 and U1 pin 10. This turns the 300 baud switch position into a 19.2kb switch. This will allow a decent baudrate between the computer and the TNC.

Remove the MF10 filter chip and discard it. Remove the component header and discard it. Use a 1000pf capacitor to couple the audio directly to the PLL.

Install .1 uf tantalum bypasses on the solder side of the board directly from the Vcc pin of the 555 to ground and from the output rectifier to ground. This will despike the minus supply.

Increase the value of the PTT watchdog timer by paralleling the existing capacitor with another one of the same value. The current timeout is too short for maxframe 7 maxlen 255 transmissions.

We also goose the processor clock to 4.92 by changing jumper JMP2. On the MFJ you must cut the trace connecting pins 1 and 2 of JMP2 first. We replace the Z80 and SIO with B parts. We also upgrade the RAM speed and replace the ROM with a CMOS part.

Finally, install the TAPR DCD circuit board and you will have a really good TNC.

Hmmm... If I remember right, there are data on HF propagation effects of nuclear atmospheric bursts. Back when us and everybody else detonated nuclear devices in the atmosphere, radio propagation anomalies were at least noted and probably studied. Although all the info I have is second hand, I understand that disruptions occurred with every detonation and lasted a few hours.

Aside from the environmental and moral implications of using nuclear weapons, they present the worst kind of ionospheric disturbance. Someone correct me if I'm wrong here, but there are two basic kinds of HF propagation disturbances: increased absorbtion and turbulent disruption (like convective mixing). Increased absorbtion comes about when the atmosphere is bombarded with lots of high energy X-rays that lead to heavy ionization of the E and D layers; it can even give rise to a C-layer, any significant absorbtion by a C-layer is rare. Nukes provide such radiation in abundance.

Turbulence basically disrupts the surface of the reflecting layers, much like throwing a stone into a pond disturbs reflections from the surface. In this case, short wavelengths aren't reflected well, as the ionosphere presents a very rough surface to those wavelengths. This kind of disturbance can occur if there is a rapid increase in UV flux from the Sun. In that case, the lower ionosphere is heated too quickly, causing convective overturning and siruption of the layered structure we all know about. Magnetic storms can cause the same thing due to large changes in the electric currents that flow in the ionosphere.

In the first case, long wavelengths are readily absorbed and so quickly attenuated. In the latter case, short wavelengths aren't reflected well while long wavelengths aren't as strongly affected. A nuclear device will cause both affects to occur simultaneously. During a magnetic storm (or a big UV flare) long wavelengths do well and communications move to lower frequencies. During X-ray flares, long wavelengths are affected, and communications move to higher frequencies. In the worst case (major storms) long wavelengths are useless due to absorbtion and short wavelengths are useless due to turbulence. The magnetic disturbances from a nuke are noted world-wide, while the radiation effects are localized. Thus a nuke will resemble a SID (sudden ionospheric disturbance) with some diabolical twists.

So, hypothetically, what bands come back first (assuming anyone is around to care) will depend on where I am in relation to the detonation. Far from the burst, it may well be that the low-bands are only marginally affected while close in there will be a total blackout. Depending on how long the low-altitude ionization lasts, it may be the limiting factor in communications. What I might notice is a narrow window of frequencies open up as the MUF slowly rises above the LUF.

It's all perfectly gruesome, but at least it may lend insight into how the ionosphere works.

Kim Elmore (N5OP)

> Using my "learn 8 letters and bulls__t" method, 5 out of 6 people...
> passed on their first try.

I wanna be a General. Almost bought the guidebook last Sunday but just in time I realized I'd have to up my code speed from 5WPM (OK, more like 2WPM, whatever it's atrophied down to) to 13WPM... and said "never mind". Sure I can learn it, but I don't wanna take the time and I won't use the ability. (I *would* be willing to study the General guidebook; that would be useful.)

So: Know any tricks for faking the 13WPM test? 1/2 :-)

Alan, N0MFW (a happy ham on 2m and 10m voice)

You don't say how high the lines are. The higher they are, the more voltage (and noise) they have. Some of the noise may be caused by leaky insulators - some direction-finding and a call to the power company will clear that up.

Another consideration is where the lines are with respect to your favorite DX. If you can put the power lines to the back of a beam, you might be surprised.

A dipole is a pretty cheap way to find out what the noise level really is. Just string one along the roof and check the noise level with a friend's modern transceiver, with the noise blanking on. You can orient a horizontal dipole parallel and perpendicular to the power lines to simulate what a beam antenna would be like.

I live next to a fairly busy street, and get ignition noise from passing cars, so I can commiserate with your situation. Good luck in your investigation, hope it works out.

Ah, yes, the cryptogram method. I recommend it to anyone that has absolutely no intention of ever using CW.

One way to memorize the letters is by creating a binary tree, assigning "dit" to the 0-side, and "dah" to the 1-side. Assign each node the code letter generated when traversing from the root to that node. Finally, make up a silly saying based on all the letters produced, like "Extra Terrestrials In The New Mexico Sun Usually Require Water for DrinKinG".

Again, this is for those people who have ABSOLUTELY NO INTENTION of ever being CW-literate.

Re: any tricks for 13 WPM ?

None, other than practice until you have 10 wpm solid, then go to every test you can find until you get lucky. I got lucky, because one of the written test had a direct quote from the code test. I was able to fill in enough to get my one minute "solid" copy. (BTW, I now copy 15 WPM, and am trying for 20. Like mountains, we take on obstacles because they are there.)

I've heard that beer bottles in a washtub full of saltwater works.
Glass dielectric, low-impedance (high cross-section) saltwater.

The advantage here is that whenever a capacitor fails, you get to
drink another beer !

>I also need a good, fast high-v switch, something easily obtainable that

I don't understand the application. By "fast" do you mean "no bounce" ?
You'll probably have to fabricate this from some relay contacts and a
large spring. One other possibility is using an arc gap as a switch.

Congratulations to Andy Goris on passing the Extra exam last Sunday. He
should be on the air in six weeks when his license arrives.

:-)

He was a ham but let his license lapse. Last Sunday, in three and a
half hours, he took and passed the 20WPM test and the Novice, Tech,
General, Advanced, and Extra written tests. Wow!

Aluminum foil and plate glass work fine. Leave about an inch per 10kv of glass sticking out beyond the aluminum foil plates. Cut the foil with a tab sticking out for connection. Stack the plates with the tabs alternating on opposite sides of the stack. Bus the tabs together on each side. This makes a fine, cheap high voltage capacitor. Seal the edges with RTV. Mount the whole assembly on plexiglass bars well away from metal.

It's hard to beat a gas thyratron tube for generating high voltage pulses. Your pulse network should switch on the primary side of the last stepup transformer for best results. It is difficult to obtain a stepup transformer with better than 20kv primary to secondary insulation so switching the primary at as high a voltage as possible is a good idea. Isolate the core of the stepup transformer from ground with plexiglass mounting plates. Use a standard high vacuum glass diode for your flyback diode. Isolate filament supplies from ground.

Enclose the entire assembly in a LARGE Faraday shield. Stand well back when powering this monster up.

Hello again netlanders. I have a visitor here from West Germany and he would
like to take back a scanner from here in the states (the prices for such
devices are A LOT less here). The problem is that I don't know the frequencies
that are used in W. Germany.

So, if anyone has any knowledge of the frequencies used by public services
(police, fire, etc.) in W. Germany, I would appreciate your quick responses.

thanks and 73s......trop

I ran across some of the WALKER (not Walter) TOMPKINS (not Thompson) books in a used bookstore a few years ago. These were the 1960's reprints.

I had previously noticed them in the ARRL Book ads.

When I glanced through them I really got "hooked," not by brilliant writing or really spell-binding mysteries, which they are not. But they are decently written, the stories are OK for a juvenile level (the intended audience) and the characters' personalities and mannerisms were simple but basic to the story. They were just enough under caricture to be almost believable. (I mean, I've known people like some of these guys!)

One thing stands out: K6ATX loved ham radio. That shone through strongly and impressed me to make a point of buying a full set from the ARRL booth at the next hamfest. (They sit on the shelf next to my Tom Swift Jr. collection!)

(NOTE: K6ATX was also the callsign given to the hero Tommy Rockford.
A postscript mentions that all the calls used were real, and were used with the knowledge and consent of both the call holders and the FCC.)

The stories were updated in later printings. In the older edition, Tommy was using a DX-100, and in the later printing of the same story, he had a more contemporary Heathkit transceiver.

I read the news of Walker Tompkins' death just after reading the last K6ATX novel, "Murder by QRM". I was saddened that there would be no further stories.

I recommend that you check the local library or ask a friend... like I say, not pullet surprise literature, but most hams will identify with it.

I'd be curious of the reactions of "modern" kids. Would they consider it corny? Maybe, and maybe they're right. But the feeling for ham radio is there. How corny is that?

:-)

If any of you out there have teenage or pre-teen kids, how about giving it a try and letting the net know...?

Cheers,

Bob WA8YCD

Oh, wonderful. Sure. Sue the volunteer who is donating his time trying to help you get your ham license. That will encourage more hams to volunteer their time and services knowing that they will get nothing in return but trouble.

I just took my novice test... AN PASSED!

1) Yes, I took the 5 wpm code test, without gimmicks, and passed.
   - I listened to the code tapes that come with Tune In The World for 20 minutes per day for two weeks.. This was *all* I did, and was obviously all I needed.

2) I think the no code debate is a crock of <insert noun here>.

I actually *enjoyed* learning the code! It wasn't hard. As a matter of fact, it was easy. Regardless of the fights against the code requirement, I do not believe that 5 wpm is a difficult requirement whatsoever.

I recently came across a set of crystals for "Model R D Z receiving equipment". These are a bunch of crystals in a nice metal case whose frequencies range from 5185.42KHz to 6326.56KHz. Each crystal is marked with a notation like "RDZ233.8" which for example corresponds to 5185.42KHz. The RDZ notation would seem to be some sort of code for the frequencies of the crystals. There is a paper chart inside the case with all the frequencies and RDZ codes for the crystals enclosed. This list is marked "Restricted" and the unit was made for the U.S. Navy. Most of the crystals also have an ink marking such as 9/53 or 11/53 etc. I would assume these are the dates the crystals were made.

Does anyone out there know anything about the gear these were used in?

Uh, almost...There was one story with a new kid with the call WV7XNN...the WV7
prefix would be kosher, but the XNN suffix is a no-no.
(WV-prefixes were used when it was necessary to distinguish those Novices
destined for Ws from those destined for WAs after they upgraded.)

There are now a total of six of this series by Tompkins (before he became
Silent Key in trhe past couple of years). There is a new series by a
younger author (Wall) with one book so far.

All seven of these books are available from the ARRL at hamfests or by
mail. See QST, October 1990, p. 167 for a list of books, prices, and order
information.

They are NOT big sellers, I believe, but superior to some of the drivel
I've seen ADULTS reading recently.

Remember the AMSAT DSP Project? As part of the project, Tom
Clark negotiated a package deal on a bunch of Dalanco Spry
DSP boards for the project members to use. Being a DSP nut,
I chipped in and bought one. Shortly thereafter Tom and Bob
(N4HY) fell down the Microsat hole and have not been seen
since (just kidding).

I just upgraded my PC, and the Dalanco Spry board won't fit
in the new 386 motherboard, which has no true 8-bit slots.
Therefore I'd like to sell it.

The board is the Dalanco Spry Model 10, which is based on the TMS 32010 chip. The boards we got were the higher-speed 25 MHz clock version. I replaced the original hand-picked 320 chip with a GI (now Microchip) CMOS 320C10 rated to run at 26 MHz. The board has 4K x 16 bits of dual-port RAM and 40 K sample/sec A/D and D/A converters (12-bit, I think). Bob, Tom, and some other people put together a package of development software tools and some other neat stuff, including several different modems, an audio spectrum analyzer, etc.

The one caveat is that the board ONLY fits in an 8-bit slot, because of its physical outline. It should work fine with any PC or clone that runs the bus at standard rates.

Original cost was close to $1000, and we paid just over half that. I'll part with mine for somewhat less. Of course, the associated software, manual, etc., is included.

If you're interested please EMail me directly or call me during West Coast working hours at 213/450-9111, x2628.

Okay here's one for all you audio repair hackers out there. I inherited an old solid-state stereo receiver the other day which contains some dead audio preamp chips labeled SK9426. I can't find them in the IC Master so I assume they are somewhat rare/obsolete. Anybody ever heard of such a chip? Mucho thanks.

From actual experience I find that the interfering signal (defined as the one that LOOSES in a "double") has to be at least about 15db weaker to allow the other signal to be copyable.

> In your local police example, the various officers are almost

The reaction of AM to interference is linear. The reaction of FM is non-linear and varies with the modulation index.

Compandored AM could be an interesting mode to try.

The Illinois Vehicle Code has a law in it that requires you to notify the authorities "by the fastest means possible" in the event of an accident resulting in injury. I suspect it might only apply if you are or were in and/or operating a vehicle. I don't have the code book with me or I would cite code and verse. I may do that later on.

My personal interpretation of this law is this. If I have my radio with me and it can communicate with the authorities, then IS is THE fastest means possible.

What I have not determined yet is what I will say and the operating procedure I will use. I listen on there a lot and am already familiar with how they operate, so I believe I could fit in FUNCTIONALLY, at least in my hometown area. In addition, as a volunteer (storm spotter) for the county ESDA (Emergency Services and Disaster Agency) I have a radio ID already we use on storm spotting on the ESDA frequencies.
The dispatchers do at times talk to a few other ESDA people using their ESDA ids on the ESDA frequencies and once even on a NON-ESDA frequency, so I believe if I used my ESDA id when calling the dispatcher, they would have a functional handle to work from. Will they believe me? If I was going to pull a prank, I could call 911 from a pay phone, and I have heard

them send fire engines out to prank reports before and they were even sure it was a prank. Better safe than sorry. The radio and the phone calls are all recorded, so my voice would be on tape either way. If I am questioned as to the appropriateness of the use of the radio I can certainly cite the Vehicle Code. Whether or not the use of my ESDA is would be considered appropriate in such a case, my only defense would be that "it was an identification the dispatcher could immediately deal with".

I would followup any such use of the radio with a written report to the appropriate authorities so they would know exactly "what, when, and why" of the incident. Only after that will I be able to REALLY find out how they react to such use of their radio frequency. Being in ESDA has a slight advantage in this case as well, I believe.

I believe the UHF and higher bands will come back first. I would expect the HF band to be totally absorbed for a good while (but not days) after the blast. The cummulative effect of a multitude of blasts could cause some major (and maybe long term) radio blackouts and/or some wierd and unexpected propogation modes.

This all assumes you live.

I rarely answer questions that start as illiterately as 'Okay' but....

The reason you didn't find the SK9426 in the IC master is that it's not an IC. It's a matched dual PNP transistor with common emitter leads, intended for use in differential-amplifier circuits.

An NTE-43 is one substitute; check with your local tv repair parts shop
to see if they have some.

A note of caution: the SK series is/was RCA's "universal replacement"
line of parts, just as the NTE parts are. Those parts were rarely used
in new production (unless it's a homebrew) so you have to consider:

1) the unit you've got has probably been fried and worked on before

2) you're trying to find a substitute for a substitute, so there's no
guarantee that the third-hand part is going to work at all well.

Enjoy.
     - Brian

As regards writing down dots and dashes, suing VECs and the like:
Jeez, guys, it's a $%$@# hobby, for goodness' sake. And personally,
I thought it both a matter of honor and a personal acheivement when
I passed my 5 and 13 wpm tests.

As for calling the cops on your HT...okay, If you're Bruce Willis standing on the roof of a hotem full of terrorists. But really, you *know* the cops don't like it, so why do it, other than to engender bad feelings for *all* hams and to play policeman? If you wanna do that, go join the police force.

If you feel you *must* contact police by the quickest method possible, go buy a cellular phone or a Bat-signal.

>
>
> I have a friend who tried 4 wire ladder line. Works even better than the 2 wire kind. The line radiation losses are much less than all but the most expensive co-ax. He tells me that in the hills of Kentucky, where he lives, people living at the bottom of a hill put their TV, CB and ham antennas on top of the hill and run 4 wire lines several hundred feet to the bottom of the hill with great success.
>

About 11 years ago I was driving on a country road in the hills along the border of east Tennessee and North Carolina. I came around a bend, and suspended over the road was some real rickety looking open wire line, draped over some homemade supports lashed to trees and fence posts. Looked like something from an old Gil cartoon in QST.

I looked up the hill to my left, and the line continued up to an old weather-torn TV antenna on a short homemade mast. I looked to my right over the cliff, and the line continued on down into a ravine, where it ran along a fence, with open wire feeders tapping off and running into several little shacks.

It was a hillbilly CATV system!

Can anyone shed some light on the technical standards that facsimile machines follow? Another engineer in my office is looking to buy one, and he started asking me questions about fax protocols; I didn't have the answers.

We figure that the "G2" and "G3" designators, that the fax manufacturers are so happy to sprinkle throughout their spec-sheets, must be referenced in some CCITT document.

A `buzz-word' query; is a "pel" another way of saying pixel (picture element)?

A Canon fax spec-sheet inferred that a "G3" compatible machine could run at several different speeds (starting at 9600 baud, and working at 3 or 4 lower speeds; bottoming-out at 2400 baud).

From that, I would infer that the "G3" (or "G2" I suppose) protocol must define the way in which a document is scanned (number of lines per inch; number of pixels per line; modulation technique; start-stop-control characters), while leaving the question of transmission rate still a variable.

Comments would be appreciated.

Thanks,

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com

I'm in the market for an HT, but I think I only need 2M. I'm interested in peoples pro's and cons for the Icom 2-SAT, 2-GAT, Yaesu FT-411E, and any other model they think is worth while. In fact, why don't I just conduct a little survey here, and I'll post the results. If someone has already done this recently, could you please mail me the results? thanks.

The survey:

1. What is your favorite single-band (2M) HT and why?

2. What features do you think are important in a 2M HT? (e.g., obviously DTMF, but what about # channels, sub-audible encode/decode, clock, etc.?)

3. What antenna's do you recommend for it and why?

4. What batteries do you recommend for it and why?

5. Are there any other accessories you recommend?

6. Is there any dealer you would recommend or not recommend?

I realize a lot depends on how much you want to spend, what you want to do with it, etc., but I'ld still like to hear people's opinions to these open-ended questions.

Since I'm asking for so much data, I thought I'ld offer a little in return. I called around for prices on a couple of HTs, and here's what I found out:

HT Prices Surveyed On 9/27/90

May/90 QST page		phone	Icom IC-2SAT	Icom IC2-GAT	Yaesu FT-411E
184	Reno Radio	800-345-5686	$315	$365	$335
192	Missouri Radio Center	800-821-7323	329 A	365	335
176	Jun's Electronics	800-882-1343	315	375	349
159	Austin Amateur Radio	800-423-2604	349	359	329
150	Madisson Shopper	800-231-3057	---	365	329
120	Barry Electronics	212-925-7000	370	270	340
109	R&L Electronics	800-221-7735	349 B	369	339

I have had fair success cleaning capacitors by using an ultrasonic cleaning
bath and dishwashing detergent.
A period of 4 or 5 hours of being bombarded with ultrasound shifts all the
old grease, oxide, dust from between the plates etc. and brings the
ceramic stator insulators up like new. The same treatment can be used for
bandswitches , tube-sockets, open-type volume controls, and roller-coasters.
Note i would caution against using organic solvents with some components;
these solvents can dissolve or distort plastic parts. Phenolics in particular
behave very strangely. I have lost a number of tube bases this way..!
After cleaning, wash thoroughly in fresh water, and dry in an oven (to make
sure all the moisture is driven out of the ceramic parts...) the re-lubricate
the bearings with light machine-oil. Do not over-lubricate, since the oil will
attract dust.

This treatment can make avast improvement to a 'drifty' VFO. I gave the
tuning capacitor of my AR88 just such a washing, and the stability was
much better afterwards.
Take care to avoid damaging the capacitor plates though, or you will probably

mess up the dial calibration or tracking.

I decided to spend the evening reading some trash, there are only so many computer manuals anyone can digest, and being fresh out of bodice rippers, I grabbed the October QST.

On page 14 was "The Club Bouvet, 3Y5X, Story". I usually expect the "How we worked the States from a coral reef" stories to be in CQ, but it seemed like good light reading so I gave it a go.

I noticed on Page 15 that on of the picture captions said: "...The PC is used to log contacts and communicate via Inmarsat." I wondered why, they had a boat offshore, which according to the story had full Nav and Comms. Why, with all that Amateur Radio gear around on this storm lashed piece of rock do they need to chopper in an Inmarsat terminal? Must be so they can assure the XYLs at home that they are eating well and sending out their laundry.

I turned the page and read on with this story about how to spend $330,000 on a trip to an island that not even penguins are too happy about calling home. So half way down column one on page 16 is one of those amazing coincidences that makes life so worth while: "After more than 25 hours of hard labour, punctuated by only a few hours of sleep, we were quite exhausted. Happy and ready for the DX operation, we moved up to 14.145 MHz and Einar worked LA6VM as the first station."

Absolutely bloody amazing, I suppose LA6VM had been crouched by the rig, amphetamines in hand, for days waiting for a peep from his Norgie chums in the South Atlantic. But read on, in the next column is more riveting ham radio news: "The new Inmarsat satellite system was impressive, providing two-way public TELEX service from our laptop computer via a tiny omnidirectional antenna for weather reports, press releases and other project correspondence. We also had an HF voice link to Norway on frequencies outside the ham bands."

Only a cynic would envision a scenario where an exchange is made via Inmarsat to schedule a CW QSO on 20 Meters. Amazing where technology has taken us.

I assume all the CW gear was to back up the Inmarsat terminal (-:

I call it "cable ladder for squirrels." Open-wire line has low loss and is inexpensive. It works well for people who live in deep valleys and must run long lines to TV antennas on mountaintops. Satellite dishes have replaced a lot of open-wire TV line in Appalachia, but some very elaborate systems are still in use. Sometimes they string the line across valleys, hundreds of feet above ground. A helicopter pilot for an Eastern Kentucky coal company told me that he doesn't like to fly below the mountaintops because of that stuff.

I have seen window glass and aluminum foil used on Tesla Coils.
Window glass has a dielectric constant of about 7 and a very
high puncture voltage. As I recall 7 is one of the higher
dielectric constants so it would take less plate area per
Ufd and therefore have less inductance than most other common
substances and the price is right.

>[. . .]
>If there is a nuclear war, I don't think cancelling ham radio will
>be a high priority action item in the 2 hour war scenario.

According to the results of research performed by SRI in the
50's, from the time of a (large) nuclear detonation until
many hours (days ?) afterwards, HF propagation is essentially

non-existent. So, HF ham radio and in fact all HF communications
will be temporarily " canceled" by fiat in the event of a nuclear
war.

Also, do you see that Yamaguchi Mach V transceiver there on your
desk ? If people start exploding nuclear bombs, it will most
likely become a $1K paperweight due to EMP effects.

Just in case nobody knows any more,

About 25 years ago, a MARS-connected radio club had a TDZ/RDZ pair in
their clubhouse. That's the only ones I've seen. RDZ was the receiver
and TDZ the transmitter, of course. These were BIG rack-mounted HF (?)
gear. Of particular note was the motor tuning. You pre-programmed them

with all the front panel knob settings (lots of 'em) and when you switched channels, motors turned the knobs to the right position. Sort of the ancient equivalent of today's no-tune radios.

I think they were AM gear, probably using 2C39s, 4X150s, or some such finals in the TDZ. Brings back memories. Anybody have an old Fair Radio catalog?

```

Sorry to post this to the net, but I can't get there from here.

For GARY, KE4ZV:

Could you post or E-mail me information about the mods you did to MFJ-1270 TNCs? I have had some problems with my 1274 (same thing with LED display) that your mods may fix or improve on.

Thanks and 73,

Michael

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

*BUZZZ*  Sorry, but thank you for playing. :-)

You must have an "official" station location within the jurisdiction
of the FCC. You don't actually have to have a station there, but you
must have an X drawn in the dirt that you can call your own somewhere
in the states, territories or protectorates.

Bernie - don't take it too seriously. Reading this net is a bit like tuning across the ham bands. There's a lot of funny noises, and different conversations going on about all sorts of aspects of the hobby. Do what you do on the bands, tune past anything that isn't to your liking, but listen to the stuff that interests you and join in if you feel like it. I've met some really nice people through the net, we correspond (mainly about DXing) on an almost daily basis. Just as the loudest signals on the air are not necessarily the people you want to work, you can ignore anything you want to on the net - works for me! This is a pretty friendly and helpful net on the whole, it's just a bunch of real people airing their views, which don't always interest all possible recipients. But don't take anything personally, it's rarely meant that way by anyone on this net!

I suppose it is the "curse of the net" to have newcomers post the same questions over and over... but, since I can't seem to find a coherent answer elsewhere, here goes.

While I'm waiting for the FCC to process my paperwork (!), I'm shopping for a 2m handheld (which one to buy is another one of those questions.. but later, perhaps). My family and I will be traveling to Baja for the '91 eclipse and I'd like to use the rig while down there. Locating any holes in potential cloudcover would be the primary use, but its emergency potential would be a comfort too. I ramble.. so, what problems am I likely to encounter with the Mexican authorities? Will I need some sort of permit? Do I have to retake the code test in Spanish? :-)?

Thanks in advance!

-Rick-

I realize that I may get flamed by the "real" programmers (the "Extra Class" of softwaredom), but here goes. BASIC isn't a "toy" language for the average joe who wants to do something with his computer without getting a CS degree. Because it is plain english (sort of), I can whomp out an occasional program that fits my needs. For my more advanced needs, I can look to the professionals. Looking down one's nose at BASIC users is tantamount to looking down one's nose at Novices.

Actually: Aircraft IDs.

For a number of years I've been seeing an Air France 747 with an N....
registration! Presumably dryleased from some US outfit. The Air France
737s in the Carribean had N... registrations, but they have been replaced
by 727s with F.. registrations.   I recall hearing of some US local service
airline operating with G-registered planes until they got US certification.
Could this be true?

All the current NASA-bashing is really getting to me...

Someone locally predicted that everyone would completely forget that the
current series of launch scrubbings would be for safety reasons, and would
instead focus on the fact that we'd scrubbed. From Jim Grubs' comments here,
as well as others I've heard just about everywhere I listen, they're completely
right.

_I_ am getting tired of the double standard here: first NASA is shot at for
trying to launch too quickly, and cutting corners on safety in the aftermath
of the Challenger accident, and then they're shot at for taking precautions
for safety reasons and delaying flights. You can't have it both ways!

   Well, you could say that. I think he meant that he's embarrassed by the fact
that we can't get a rocket in the air because of techincal problems, not because
it looks wimpy to cancel a launch.

I wouldn't bash Radio Moscow to badly if I were you. Our own house isn't exactly clean.
When I lisved in Newburgh, NY, I used to be able to tell when the finals of a radio station in NE PA were going soft. Their 3rd harmonic at 4020 came in clear as a bell and interfered with various MARS operations along the east coast. You can only pick up the fundamental about 30 miles from the station so I would say that a 3rd harmonic that strong 250 miles (and more) is somewhat of a problem. Complaints were filed both with the FCC and with the applicable Military agencies. No action was ever taken to my knowledge.

But, that's one of my favorite tricks -- after W1AW is done, the
frequency is "clear" for a few moments, and lots of people haven't
finished reaching for the knob yet..._somebody_ will call CQ, and
if they don't, I sometimes do, and I've made a lot of WAS contacts
that way by calling CQ to a particular state.

See you in London!

From my urban QTH, I consistently hear a number of closely spaced carriers centered on 28.500 MHz. They seem to be coming from several different directions. All are quite weak, but must be local since they are present even when the band is completely dead. Has anyone else heard these signals? Is there some consumer device that uses a 28.5 MHz oscillator? (These are REAL signals, not artifacts of my receiver, or anything like that.)

The PK88 is ok. Most TNCs are ok. We've used a lot of MFJ1270s in our network and have found out the little tricks to make them rock reliable at unattended sites. Currently we are installing only Pac-Comm Micropower Tiny 2 TNCs. They are very low power, have high integration, are cheap, and our reliability track record with them has been extremely good.

You may find that interfacing the Icom HT right is a little tricky. Implementing PTT properly on this series requires a careful choice of pulldown resistor and coupling capacitor to get both good frequency response and good PTT key up delay. The radio tends to key very slowly if you use too large a time constant and tends to have lousy audio if you use too short of a time constant. Start with a .1 mfd cap and a resistor in the 2-3 kohm range and adjust for best results.

I earnestly seek comments on abreviations for some units we all commonly see:

Quantity	Unit	Abrev.	Remarks
storage capacity	binary character	bit	This doesn't look like an abreviation to me, but "b"

			is already used for "bar" or "barn". What else would you suggest?
storage capacity	byte (eight binary characters)	by	or would you rather have "octet" and "o"?
modulation rate	baud	Bd	named for Baudot
digit rate	digit per second	?	bit/s suggested, however what do you all think about naming it for Claude Shannon? Thus the unit would be the "shannon"; the abreviation would be "Sh".

Remember that these units and abreviations have to work in a lot of languages.

Howdy:

Recently I place a call for help in getting development tools for the Harris RTX-2000. As I told you later, the response was great and I wish to thank one in particular. Tom Sefranek, WA1RHP, has made an indefinite loan of his RTXDS and development tools to AMSAT for the development of code for this engine. The RTX-2000 wil fly soon on RS-14 (RO-21 after launch) and on Phase III-D (the follow on to Oscar 13). AMSAT-NA, AMSAT-DL, and well all of us thank Tom for this kind loan.

Bob McGwier

beams@norvax.UUCP (David Beams) asks about QSL information:

--The mailing address for 7X3DA was reported in an earlier issue of the W6GO QSL Managers List (issue 125, I think). Does anyone have access to this list who could e-mail me the address?

The address in the W6GO/K6HHD Managers' List is:
A. Djoudi, Box 1033 LM, Laghouat 03000, Algeria.

The address on his QSL card is:
Abdelhamid Djoudi,
Avenue des Freres Menouar,
Lotissement Bouameur,
03000 Laghouat (Algeria).

--I recently worked UM8MBA who requested that QSLs be sent direct. My '89 Callbook has no address for him; does his address appear in the '90 edition?

I also have a card from him, it came via the bureau (not in response to mine, although I sent one that way). The only address on the card is your friend and mine, Box 88 Moscow. His address in the '90 CB is:

Ivan Udovin, Box 745, 720017 Frunze.

I have also found W3HNK very helpful in getting some USSR cards. Send him your card, an SASE (25c stamp) and $1, and he can often get the card for you. Some come quickly, some come slowly, some never come, but that is not his fault. The Managers' List sepcifically mentions that W3HNK can get "any UM8 card".

--And, on the subject of QSLs sent direct to the USSR: what does
one include for return postage? Does the USSR now exchange IRCs? Or
is it customary not to provide return postage for a direct QSL into the
USSR? I have never sent a direct QSL to the USSR; I always used Box 88.

If you send anything direct to Box 88, make it just a card (no IRCs, no filthee Yankee money - that can cause trouble for the cardee). I have sent IRCs to the USSR many times and they are clearly acceptable, since I nearly always get a card in response. I suspect that the IRCs are used to send to other (non-USSR) hams so that the USSR guys themselves can collect DX cards. I have had USSR hams tell me that they received my card without the IRCs originally enclosed; in cases like this they always send me a card anyway, and I always send them a couple more IRCs. They then sometimes write to tell me that the second lot reached them OK! However, I don't think they can obtain IRCs by going along to the local post office, so they are probably not directly cashable there. One thing you could try is to offer to get a card or two from a US manager for the USSR guy if he is a DXer.

--This question may appear rather juvenile to the more-avid DX enthusiasts
of the net community, but I am an occasional DX'er and my most formative
DX experiences came in the years when Box 88 was the *only* way to get a
QSL into the USSR.

Seems a perfectly sensible question to me. The net has some Big Time DXers on it, some novice DXers and lots of people in between. I regard answering some of these queries as serving the Public Service aspect of my license :-)

"bit" sounds good. And it *is,* afterall, already a contraction from
"binary digit." An early mention of this appears in Shannon's 1948 paper.

```
>digit rate          digit per second     ?    bit/s suggested, however what
>                            do you all think about naming

>                            the unit would be the "shannon";
>                            the abreviation would be "Sh".
```

Hurray! This is a grand idea. Claude E. may finally get a unit named
after him! Now, Bob, all you need is to find something to name after
Nyquist, too. 1/2 :-)

Uh, Bob, what's an RTX-2000? I see the phrase "DSP" in your keywords, so maybe it's a DSP microprocessor? If so, what will it do on the satellites?

>The RTX-2000 wil fly soon on RS-14 (RO-21 after launch)

This is the first time I've seen a Soviet ham satellite called anything other than "RS" when it's in orbit. Why will this one be called "RO"? What does that stand for? And why "RO-21" when the current transponders are RS-10/11? (I guess RS-12/13 is still waiting in the wings?)

I have been off the air for many years and have been thinking about getting on again. Back in the 1960's(when I last operated) there were weekly sessions of high-speed code practice(usually 40-65 wpm) sent out by several stations with proficiency qualifiers every month or so. Are there any stations(other than the usual practice from W1AW) which still send high

speed code practice?

>trying to launch too quickly, and cutting corners on safety in the aftermath
>of the Challenger accident, and then they're shot at for taking precautions
>for safety reasons and delaying flights. You can't have it both ways!

Sure you can Jay. Shoddy workmanship and poor design lost Challenger after NASA cut safety corners due to launch pressure. Shoddy workmanship and poor design have caused numerious launch scrubs after NASA started paying attention to safety again. The problem is still shoddy workmanship and poor design either way.

There is plenty of blame to go around. Congress is at fault for an erratic budget process that played hell with the design of the shuttle. The current shuttle is certainly not the shuttle NASA wanted to build. The contractors are certainly at fault for letting bottom line pressure cause shortcuts in the design and manufacturing process. And don't forget that Rockwell contract employees, not NASA employees, prep the shuttle for launch since budget cutters decided to privatize launch services to the lowest bidder.
NASA is at fault for continuing to beat a dead horse.

The shuttle was originally sold as a way to reduce the OPERATIONAL costs of launching things into space. Unfortunately, political decisions were made in Congress to cut the design and procurement costs instead. This resulted in a vehicle that is not cheap to OPERATE nor safe to OPERATE nor reliable to OPERATE.

Bandaids aren't going to solve this problem. It's time for NASA to claim that the EXPERIMENTAL shuttle has been a sucess in teaching us what not to do and now it's time to start over with a clean sheet of paper to design a real, workable, operational shuttle.

One nuke will not cause a nuclear winter. Many have been explode above ground since the 1940's and there is no nuclear winter. The problem that could cause that is a massive release of enormous numbers of the larger ones that exist now.

One nuke WILL cause a WAR. That will result it shutting down of ham radio and resultant military conflict. That conflict might be massive nuclear and could result in nuclear winter and shutting down of government. What will result, if anyone is left, is PIRATE radio.

The original question about the effect of nuclear winter on propogation is fine and applicable in such a context.

We can speculate on what will happen, but I don't think we will know what actually will happen unless we get this scenario to try things out on.

This ham radio discussion group is as widespread as it is just because we
are addressing (nearly) the lowest common denominator. If someone wants
to address only those running a higher level of software perfection, then
I suggest you create your own network and let us know how well it does.

What might be to you as excellent quality software might not even work
on some other platform, and might be very unfriendly in other regards
such as customizing the user interface.

The solution to this problem is quite a simple one:

If you have public domain or freeware software to distribute:

1. Announce about it on the appropriate topical group, describing what it does and where it can be obtained. Keep its size to the limit used by other items on the newsgroup.

2. Make it available by as many of the following means as you can:

    a. Post it on the appropriate software distribution newsgroup. If your site does not have access to these groups, maybe you can contact someone who can post it for you.

    b. Make it available for FTP access. If you have FTP client access only, FTP it to vmd.cso.uiuc.edu (cd phil.512) and leave it there. Everyone has write/delete privileges. If you have no FTP access, maybe you can E-mail to someone who does.

    c. Make it available on an E-mail based fileserver if you have access to one.

    d. Offer to email to anyone requesting it if you have the time and resources to do this. Urge that requests be E-mailed rather than posted.

    e. If you are willing, offer to smail-mail the software on the appropriate media, in exchange for cost of time and materials.

    f. Submit copies to distributors of public domain software (with a signed release stating you are releasing it to the public domain).

    g. Send copies to applicable magazines. They might write a review of it.

DO NOT post the actual software to a talk newsgroup unless it is very short (under 72 lines might be a good limit).

> is good enough. I think there is enough room also for a simplex freq also.
>
> I have no problems with 438-442, if it is used appropriately. I still think
> split freq is better.

What is a good alternative? The "usual" bandwidth is 6 Mhz when the suggested vestigial sideband is used. You could trim things even tighter, but no one makes anything to do that yet, and the best you could hope for would be about 4.8 MHz. Suggest a place to fit that in.

> AEA is one of the culprits. From what I understand, the AEA unit will
> not work on a non-interefence basis below 442. (IE, it's output will

> ATV'ers at Dayton.

No, AEA is NOT the culprit, but rather the culprit is the bandplan which puts the carrier at 439.25 MHz and that will generate signals all the way up to nearly 444 MHz even if the filtering is working correctly.

> I asked how I could run an ATV rptr in my area, while coexisting with 443+
> fm rptrs. They named one unit that would work. It was not AEA. They liked
> AEA package & price, but indicated it did not filter as well as it should.
> This is their viewpoint. I would be interested in knowing more, as the AEA

The AEA unit may or may not be filtering well, but even with a theoretically perfect filter, you will be affecting more than half of one side of the FM repeater subband.

> Actually, the ATV rptr output is usually the higher freq, due to not
> having the FM rptrs key it up. The ATV rptr will be the one needing the

Probably.

>
> Ok by me... ATV simplex seems like weak signal to me.. I do think we need
> to use the 420-440 area more.

Not everyone can use that. Remember that 420-430 is not available in all parts of the country. Try fitting just ONE ATV channel in 430-450 MHz that can be used for repeater operation. You do NOT want to put it on 432 MHz and you cannot put it on 435-438 MHz.

The 70cm band is currently very poorly fragmented.

This issue, while being certainly packet related since packet needs to definitely deal with coordination problems, should be moved over to the main rec.ham-radio group.

How do you know ham radio would be shut down? It was during WWII. Since then the US has been in several situations that weren't "official", but sure seemed like wars (ie Viet Nam, Korea) without pulling priveledges.

If there is a nuclear war, I don't think cancelling ham radio will be a high priority action item in the 2 hour war scenario.

> radio by the 13- 20-wpm CW requirement, but I do think that I demonstrated
> that amateur radio technical leaders usually are proficient in CW.
> Are you unwilling to concede this?

What you phrased may be correct, but this is how statistics is manipulated.

You state "...amateur radio technical leaders..." which implies those who are ALREADY involved in amateur radio. Whether or not I concede, and whether or not your statistics are correct, does not even matter since the issue is NOT how to get currently licensed hams to gain a code proficiency.

The issue is how to get people who are NOT now licensed hams into being licensed hams and eventually becoming "amateur radio technical leaders" (among other things).

It is asserted by us no-coders that there is a group of people out there who would become hams if the code restriction were lifted, such as by having a new license class w/o a code requirement. While this assertion has not been proven, it is not disproven either, and methods of studying it statistically would be too expensive anyway (one would have to survey a significant portion of the whole population).

Clearly, if the above assertion is correct, and if such a licensing system is enacted, and if lots of these people become "amateur radio technical leaders", then the statistics regarding the level of code proficiency will change. There will be more of them who don't know code at all.

So the CORRECT way (we believe) to phrase the statistical question would be more like:

> What is the potential CW proficiency of the combined population of current "amateur radio technical leaders" and potential "amateur radio technical leaders"? And does it matter?

The CW test acts as a filter. Your statistics studied the characteristics of those who pass the filter and ignore those who are rejected by the filter. Additionally it ignores those who avoid the filter for whatever reasons such as being confused about what ham radio really is since it still requires a Morse Code test (seen as antiquated by many) or standing on principle of just not attempting to do something that has no bearing or relationship to what they might do as "amateur radio technical leaders".

While the points about why people don't or can't become hams are arguable, it remains a fact that there are people who are not hams for reasons they believe to be applicable and appropriate.

The statistics that would make more sense in determining what to do would be ones that study the people who will become hams under proposed changes, and those who won't or can't under proposals to stop or limit such changes.

Many of the current "amateur radio technical leaders" are proficient in CW and this I will concede. But I do not concede that such a fact is important to the issue since I believe it to be irrelevant.

> I had expected that Technicians would show up in much greater numbers.
> If I had found that any substantial number of the technical leaders were
> Techs or Novices, I would agree that CW is so offensive to techies that they
> just learn the barest minimum CW and it is a serious hurdle. Do you suppose
> that the distribution is bimodal - most high-tech hams find CW no big deal,
> but most high-tech non-hams are kept out of ham radio by the code?

One of the things that it shows is that once one does overcome the hurdle of CW, that it shows that those who are "amateur radio technical leaders" tend to find that HIGHER SPEEDS are not a hurdle.

But still, your statistics DO NOT address those who have not overcome the hurdle nor those who refuse to "jump through the hoops". And it is THESE people we are trying to address in no-code proposals.

If the issue was one of lowering the CW requirement for EXTRA down to just 5 WPM, then your statistics would be good evidence that such a thing should not be done because it shows that those who already pass 5 WPM can, in at least some numbers, go on up to 20 WPM. I believe that I can do it, though I have not done it.

In any event, those interested in doing their technical leadership on the VHF/UHF/SHF/EHF bands, where most technical pioneering is taking place, are not benefitted at all by the privileges of the Extra class license.

> The British have issued no-code licences since 1964.   Has their
> no-code licence brought in a lot of techies? I looked through the Feb, Mar,
> Apr, May, Jun and Aug 1990 issues of Rad Com (the main G ham mag) (can't find
> July) and find the following breakdown of authors of their (generally good)
> technical articles:
>   Class A (code)   18
>   Class B (no-code)   1   (~ half of all G's are Class B)
>   Unsigned Q&A Article   1
> Also, the Brits are so concerned about the aging of
> THEIR ham population that they have announced Novice licencing.
> I'm not convinced that the British no-code licence has brought in either:
> 1) lots of young people, 2) lots of high-tech people.

A no-code license ALONE certainly will NOT make any such achievements,
either in Great Britain, or in the United States. It **MUST** be combined
with the appropriate promotion of amateur radio to those who would be
such technical people, as well as the general acceptance if such licensees
on the part of all other hams.

In my efforts to recruit people to ham radio, the greatest stumbling block
is in justifing the code test (which I cannot do) to someone who is convinced
that they are not going to use code. I've already posted my scenario of how
I try to do this, where I explained how I learned and forgot code, and found
the potential ham arguing the merits of trying to learn something you expect
to forget. I cannot justify it.

The people I have tried or considered recruiting are not all the technical
types, but are people who would make some contribution. They won't be
developing digital signal processing technologies to make HT moon-bounce
possible. They might put up a digipeater in a useful location. They won't
be writing articles in a technical ham radio journal. They will, instead,
be helping us conduct local emergency radio communications.

Tell me you DON'T want these people.

> Re: dipoles
>
> 70' is almost ideal for a 1/2-size G5RV. It's mostly resonant, so you may avoid buying a transmatch. It is resonant on 40, 20, 15, and 10. As a novice, I don't think you can use 20 and 15 CW, but it gives you incentive to upgrade to tech. :)
>

Better than that....feed the center of the 70 foot dipole with open wire line or twinlead (the 450 ohm transmitting type ladder line is neat) and tune it with an antenna tuner that has a balanced output. You then have the classic center-fed Zepp antenna.

70 feet is not really half of a G5RV, as the G5RV is 102 feet long. The G5RV is really a special case of the center-fed Zepp, with convenient length and matching sections so that it will operate on all bands. Feeding it with twinlead and a tuner is a lot less lossy and a lot less tricky to set up.

The classic length for the center-fed 80-10 mtr Zepp is 120 feet, but you can make it any convenient length. It probably works best if the length at least approaches 1/2 wavelength on the lowest frequency. The open wire type feed has such low loss that almost any mismatch at the feedpoint can be matched with a balanced tuner in the shack, with little loss of efficiency. This trick does not work with coax.

Oh, and one more thing....Novices can use 15 CW, and upgrading to Tech makes no difference.....Novice and Tech allocations on HF are the same.

I thought you had to be a Citizen or Permanent Resident Alien, which leaves out tourists, students, etc., who presumably have to go the reciprocal agrement route????

Precisely my point. It is not the question of whether NASA is too quick or too slow at scrubbing for safety reasons, it's the fundamental management flaw in start to finish quality control.

I think it is too easy to blame Congress. They didn't knowingly do a poor job. They did the best they could with the sense they were able to make of the deliberate snow job NASA did on them.

Why shouldn't we bash NASA? They deserve it. This is no time for sweeping things undeer the rug.

Is it legal for a packet radio station to run 'online games'? If so, has
anyone prepared any games for use with packet radio?

The ability to have up to 16 connections to the same machine at one time
makes for some interesting possibilities...

I'm reasonably close to finally getting a ham license, and the answer to
these questions will partly determine whether I start off with HF or VHF.

Does anyone get a little nervous at the thought of packet games filling the
frequencies???

Nope. The original poster was correct. You don't have to be a citizen.
You don't have to be a permanent resident. You can be a tourist or a
student. The only restriction is you can't be a representative of
another government. (We shouldn't be concerned about tourists, but
maybe a restriction against terrorists would be good! :-)

>

Ah, New Zealand. So now we have a named country that is supposed to use FM in the aviation band. A lead I can follow up on. Time to work some DX and get this confirmed. So I reach over and grab my 2500 set (AT&T of course, none of this imported stuff). Dialing 011649NNNNNNN I call Ian Ashley, ZL1AOX in Auckland. This is the ZL1AOX of Amsat fame. He is at work, so his Mrs tells me he will be back after lunch.

Ian is a senior pilot at Air New Zealand. A pilot and radio amateur, who better to answer the FM in the air bands question. I asked Ian if they used FM in the Anitpodes. He was to say the least, dumbfounded. He said that the airbands use AM all over the world, even in New Zealand. Yes, on HF, it is now SSB, but all the VHF stuff is AM. Ian flew domestic Air New Zealand flights for years. He now flies internationally. Next month he will be flying out of LAX (Los

Angeles) until December.

He agreed, that having some areas FM and some AM would require all planes flying internationally to carry an FM radio, just in case.

So it appears, that AM is the world standard still. Maybe the ATC in NZ assumed his radio was FM, assuming that FM means VHF, as it does to many people.

Ian did also say that some carriers may use FM business band for company messages air to ground, but all ATC "Air Band" stuff is AM.

I've received about 15 requests for this info, so far. It's getting a bit out of date, so I suggest you contact Norsat for current info.

Note that I don't use their product or services. From what I can see in the B.C. map files, they don't have the greatest Usenet connectivity. (They don't appear in Brian Reid's top 1000 sites, either.) I've edited as much of the commercial hype out of this as I could without loosing too much of the technical info.

They broadcast on ANIK-D1 and GE-K2.

What MICROSAT II is:

MICROSAT II is an audio/video/data satellite receiver you can install in an XT/AT bus personal computer. By integrating several functional units onto a single PC expansion card, and using the computer for control and data capture, Microsat brings reduced cost and size of satellite downlink equipment to users of satellite communications.

You don't need an external satellite receiver to use MICROSAT II or to receive data directly to your computer, MICROSAT does that for you!

What MICROSAT II does:

With an appropriate antenna/LNB, Microsat can be tuned to receive signals at any frequency in either C or Ku Band. The tuning functions are controlled directly from the computers bus, or can be set in hardware to ignore the PC's commands. Video and stereo audio outputs are provided, and data received is routed to an RS-232 standard serial port.

What you receive using MICROSAT II:

Satellite TV broadcasts, stereo radio stations carried on subcarriers, VC-II encoded broadcasts (when equipped with a VC-II descrambler).

The full USENET news broadcasts including ... alt, bionet, biz, can, comp, control, general, gnu, misc, net, news, pubnet, rec, sci, soc, talk, to, u3b, unix-pc and vnet.

What Hardware Is Required:

MICROSAT II and CYCLONE work best together in a computer with at least:

1 AT/XT Bus computer,	(standard PC)
1 hard drive	(10 Meg or more)
1 video card	(most types supported)
1 asynchronous serial card	(standard RS232)
1 satellite dish	(for C or Ku Band)
1 MICROSAT	
1 floppy drive	(for the distribution diskettes)
or	
1 modem	(fetch software via BBS or uucp)

What Operating Systems are supported:

Currently "DOS" version 2.11 or higher is required for the CYCLONE receive software, while the transmit software runs under SCO XENIX 2.3.1.

A UNIX version of the CYCLONE receive software is scheduled for release mid-August 1989.

What Software Is Provided:

The MICROSAT II comes complete with the CYCLONE receive software, which depacketizes the satellite data and performs the forward error correcting and detecting functions. Data integrity is ensured by standard CRC-32 error detection algorithms and is corrected BEFORE it lands onto your computer.

The CYCLONE software uses a forward error correction scheme loosely based on existing error correction schemes like Reid-Solomon and BCH coding but is optomized to provide low overhead on the receiving computer with the calculation intensive tasks being done on the transmitting computer.

Resource Management:

The CYCLONE software is designed to make the best use of your computers resources and to minimize maintenance. All data arriving on the computer includes addressing information such as NET, GROUP, USER, MAJOR and MINOR classifications as well as complete file system information about the file.

Incoming data can be selectively routed to subdirectories on the hard disk, printers, comports, networks, or fed as input to programs that may be dynamically configured according to the type of file being received. CYCLONE keeps track of how much data is delivered to each resource and honors the limits you specify in the configuration file.

Files can be selectively received based on classification, age, and to some degree content itself (header packet information).

How To Get More Information:

You can contact NORSAT International conventionally via phone/fax or Mail or you can request information via uucp or the support BBS.

Yes, Steve, it's still quite active. I just copied it today for the morning and evening passes, and just scanned the captured data again. I don't see anything new on the digitalker in the bulletins...Still the same text about the AIAA/US small satellite conference.

If you hear the digitalker, please drop me a line...don't want to miss that one.

I guess we all basically get what we pay for. :-)

> I was wondering if anyone might know where I might get some coils, or how I
> may go about making some perhaps?

I have an EICO Model 710 Grid Dip meter, which is probably what you have. I have no manual for it, however. I will tell you what I know about the coils, and perhaps other readers can add to it.

The EICO model 710 uses eight coils labeled "A" to "H" to cover the frequency range of 0.4 to 250 MHz. The lower frequency coils have a tapped winding, while the upper frequency coils do not. The following chart tells you all I know:

COIL	FREQUENCY	TAP	DESCRIPTION OF COIL
"A"	0.4 - 0.7 MHz	yes	lots of turns of Litz wire & tuned slug

"B"	0.7 - 1.38 MHz	yes	lots of turns of Litz wire & tuned slug
"C"	1.38 - 2.9 MHz	yes	lots of turns of Litz wire & tuned slug
"D"	2.9 - 7.5 MHz	no	approximately 30 turns of 28 AWG enamel
"E"	7.5 - 18 MHz	no	approximately 15 turns of 24 AWG enamel
"F"	18 - 42 MHz	no	approximately 6 turns of 20 AWG enamel
"G"	42 - 100 MHz	no	approximately 2 turns of 18 AWG enamel
"H"	100 - 25 MHz	no	1/2 turn U-shaped 0.125" wire loop

The coil forms for "A" to "G" are all 0.75" plexiglass, with the coil winding being about 2" from the pins.

Armed with the above information and some trial and error, you could probably duplicate the required coils.

Several years ago, I obtained a Novice license. Being 12 at the time and having no money, I never managed to purchase any equipment nor was I skilled enough to build anything that worked. My license expired.

Now, in college with a little (emphasis on little) money of my own, I have begun to look at the hobby with renewed interest. Although I still do not have money to burn, the hobby is not as unreachable as it was before.
But before I consider getting a license, I am again faced with the problem of how to get on the air, cheap.

It seems to me that the most inexpensive, educational, and satisfying way of getting one's equipment is to build it oneself from circuits in magazines, books, and the like. Performance, however, is always a question. Is it realistic to expect to be able to have any communication at all with, for instance, a one or two transistor crystal oscillator? In almost every publication I have seen, a crystal oscillator is shown as the simplest "transmitter," but no indications of actual useability are given. Has anyone out there gotten reasonable performance out of a one/two transistor oscillator?

On a similar note, is it feasable to build a useable (in terms of CW selectivity/sensitivity) simple receiver? (For me, "simple" means the circuit diagram will fit easily on one page -- a couple of transistors and IC's.)
I have experimented very briefly with a regenerative circuit but it left much to be desired.

Any pointers on where to find circuits for good, simple receivers/transmitters (if such circuits exist!) would be greatly appreciated. Thanks in advance!

SAREX/STS-35 MISSION DELAYED

HR AMSAT NEWS SERVICE BULLETIN 265.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX Mission Delayed; Rescheduled Launch Date Planned For Dec. 1, 1990

NASA officials were forced to scrub the launch of STS-35 on Sept. 11, 1990 due to the recurrence of a hydrogen leak in the aft engine compartment. Because this leak appeared to be much worse than leaks previously encountered, NASA officials will again roll the Shuttle Columbia back to the "hanger" to perform needed repairs. During the time that the repairs are being performed on Columbia, the Shuttle Discovery will be made ready for lift-off. Discovery carries a "time-critical" payload, known as Ulysses, which must be launched within a thirteen day period beginning Oct. 5, 1990. After the Ulysses mission comes a classified DoD launch on the Shuttle Atlantis. This mission is planned for November 10, 1990. NASA planners are working on a December 1, 1990 launch for STS-35/SAREX. Although four launch attempts would try the patience of even the most stalwart SAREX enthusiast, it is evident that NASA remains committed to completing the STS-35 mission goals. AMSAT would like to thank the many dedicated volunteers who have worked so hard to make the Shuttle Amateur Radio Experiment a reality. As the launch of STS-35 approaches again, AMSAT and the ARRL will start to again publish the necessary information for the SAREX mission. Watch for bulletins from the AMSAT News Service (ANS) and W1AW bulletins in mid-November for updates on the progress of the STS-35/SAREX mission.

FO-20 UPDATE/SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 265.02 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Latest Japanese Bird Still Experiencing Temperature Problems

The FO-20 Command Team at JARL report that FO-20 is continuing to experience high temperature problems which is forcing a drastic reduction of operations on the Bird. Unfortunately, because FO-20 is currently experiencing a period of eclipse-free orbits, the natural cooling off of the satellite during eclipse is not occurring. Therefore, the reduction of transponder operation availability is one way to reduce the internal temperature build up.

Although subject to change at any moment, this list is the current schedule of operation for FO-20:

From	To	Mode
25 Sep 90 0700	26 Sep 90 0910	JD, on demand
27 Sep 90 0740	28 Sep 90 0950	Continuous JD
01 Oct 90 0900	02 Oct 90 0910	PSK Telemetry acquisition
04 Oct 90 0955	04 Oct 90 2330	JA
08 Oct 90 0920	08 Oct 90 1110	JA and JD
11 Oct 90 0825	12 Oct 90 0850	JD

The above dates and time are in UTC.

The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

[ANS thanks the FO-20 Command Team for the information in this bulletin]

AMSAT SYMPOSIUM TALKS, PT 1

HR AMSAT NEWS SERVICE BULLETIN 265.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Wide Variety of Topics to be Presented at AMSAT Symposium

This year's AMSAT Symposium will be held during the weekend of October 19, 20, and 21 at the Johnson Space Center (JSC) Visitors Center. Presentations will be held in the Visitor's Center Auditorium, and have been scheduled for all three days of the weekend. The talks have been scheduled in serial alignment so that you will not have to choose between two talks at any given time.

Friday's talks, which begin at 3:00 PM include: Satellite Image Processing for the Amateur, AMSAT-NA Education Activities and finishing with AMSAT Orbital Data Management. Saturday's activities begin at 8:00 AM. A scan of the program lists talks on such topics as:

The Decoding Telemetry from the Amateur Satellites
In-Orbit Performance of 4 Microsat Spacecraft
A discussion of AO-13's Orbit
A report on the Phase 3D Project
Phase 4 Technology as it Applies to Phase 3D
Macromets and Microsats
A Pacsat Demonstration
Microsat Motion, Stabilization, and Telemetry
Full Motion Digital Video Via Amateur Satellites
SAREX Hardware for STS-35 and 37
Astronaut Deployable Satellites
Webersat Operations and Experiment Results
AMSAT-NA Operations Organization
The Development of 2 DSP Modems

AMSAT SYMPOSIUM TALKS, PT 2

HR AMSAT NEWS SERVICE BULLETIN 265.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Saturday evening's activities will be held at the JSC Employee's Recreation Center and with the ever-popular Attitude Adjustment Hour which is followed by a Texas Bar-B-Que Dinner. AMSAT is very fortunate to have as its Guest Speaker Mr. Aaron Cohen, Director, Johnson Space Center. Following Mr. Cohen's address the AMSAT-NA Annual Meeting will be held.

Sunday's activities begin at 9:00 AM and the topics to be presented will be: Getting Started in Amateur Satellites, Building a Versatile Homebrew Satellite Ground Station and Poor Boy Satellite Station. For those who can delay their departure time until late Sunday, there will be a chance to attend an open house (starting at 1:00 p.m.) at the world's largest amateur antenna, W5UN, the station that brought DO-17 (Dove) back to life.

When making airline reservations, please note that Hobby Airport is MUCH closer to JSC than Houston Intercontinental Airport. Contact AMSAT Headquarters at 301-589-6062 for further information on Symposium registration and accommodations.

SAT ACTIVITY FROM ZIMBABWE

HR AMSAT NEWS SERVICE BULLETIN 265.05 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Final weekend for Four Special Callsign Stations

You have only one more weekend to pick up on four special prefix callsigns sponsored by OSCAR enthusiasts from Zimbabwe. Z21HJ/R and Z21GH along with the active support of the Zimbabwe Amateur Radio Society have been sponsoring four separate satellite stations operating from four different locations around Zimbabwe. These stations have been issued the call-signs: Z21SAT, Z22SAT, Z23SAT and Z24SAT (pre-fix hunters should find some interest in these calls). The stations have been found on Mode B around the frequency of 145.905 MHz.

Special QSL cards will be available for each of the four stations. ANS has been informed that QSLs will be sent either via the bureau or, if a speedier reply is desired, the standard DX-QSL protocol of including an IRC will hasten the card reciprocation.

In addition to the special QSL cards, those stations who have worked at least two of the four call signs will qualify for the "ZIMBABWE SATELLITE ACHIEVEMENT AWARD 1990". This beautiful award is based on African culture and shows the famous Victoria Falls in the background. The award will be available for a nominal donation. Further information on QSLing and the award should be available from the stations during the operation.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 258.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Alt.	U.S. day
28 Sep 90	171	J/L	0100	KA5SMA	N5BF	Thursday
9 Oct 90	172	J/L	0015	WD0E	WB9ANQ	Monday
- 15 October 90 reorientation to 180/0 -						
21 Oct 90	98	J/L	1800	WB6LLO	W5RRR*	Sunday
27 Oct 90	135	B	1300	WB9ANQ	KA5SMA	Saturday

* Most NCS operators will be at the AMSAT Symposium at JSC in Houston, TX on 21 October 90. As a result, this net may be cancelled.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and checkins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13.

Write to AMSAT Headquarters with your schedule and we will run it in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-265.07
AO-13/AO-10 TRANSPONDER SKED

HR AMSAT NEWS SERVICE BULLETIN 265.07 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8 which is planned to continue through October 17.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods. Satellite reorientation (a.k.a. magnetorquing) is scheduled to commence on October 15 and once it has been completed, it is expected that Mode S will be returned to service.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals show signs of FMing. Until further notice please DO NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

SB RTTYDX @ ALLBBS $RTDX0921
RTTY DX Notes 1of3 9/21/90

RTTY DX Notes for week ending 21st September 1990
BID: $RTDX0921
Part 1 of 3.

Despite the remarks of packeteers about the slowness of AMTOR (and for that matter RTTY), it would appear that someone has their figures badly wrong. I have seen packet messages take 12 to 14 days to get across the USA and another 5 days to be delivered to Sydney. As a matter of interest and test, I asked a station in New York to send me the same message by AMTOR and packet. I received the AMTOR message in 12 hours and the packet message via APLINK in 9 days. Oh, heck. Possibly my calculator was wrong. All this to say that there appears to be more and more stations using AMTOR to pass their traffic. One wonders if they are realizing that after all, on HF, AMTOR is best.

Our thanks this week go to I5FLN Cluster, JA1BLV, OD5NG, TG9VT, W2JGR, W6/G0AZT and the Tri-State DX Packet Cluster Network. Thank you all for the informative DX Notes.

QSL Information.

TA3D informs us that his QSL address is Box 963, Izmir, Turkey.

S79NBD is JG1NBD when he is at home.

5W1KT says to QSL to Box 1672 Apia, West Samoa.

YS1RJ collects his cards from Box 792, San Salvador, El Salvador.

J28TY QSL address is Box 2417, Djibouti.

HV3SJ says to QSL for this contact to I0DUD.

Cards for the latest 3DA0BW operation go to Paul, Box 57 Big Bend Swaziland, not to AK1E as for previous operators.

V63AR is JA2NVY when he is at home. QSL via callbook address.

Notes of Interest.

JH1QDB, Kuni, will operate from Ogasawara JD1 from September 23rd to 30th. QSL to his home call.

W6/G0AZT has told us that he will be signing ZF1RY from 27th September and through the CQWW RTTY Contest. QSL to his home address.

Juan Fernandez. F2JD expects to be signing CE0ZZZ mid November for a period of about one week. RTTY gear by IRDXA.

Malpelo (HK0) is still indicated for 2nd November. Financial assistance should go to HK3BED at his callbook address.

South Sandwich VP8SSI and South Georgia VP8SGI are still on track for November 26th and December 1 respectively for a week or so operation, RTTY of course. Financial assistance should go to AA6BB/7 or KA6V/7. Callbook address is OK.

GL DE DX1.

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

I've seen descriptions of modified AM (0.54-1.6Mhz) radios for ham band reception. Basically, you treat the radio as a tunable intermediate frequency amplifer, and you put a downconvewrter stage in front of the radio's front end. You need to put the radio's loopstick in a shielded can, so you don't continue to receive AM radio stations. You will also need to build a Beat Frequency Oscillator (BFO) to inject into the radio's IF strip. This is an oscillator running at the same freqency as the IF amp, and acts as a substitute for an AM radio station's carrier. Inject it at the diode detector stage, so you won't confuse the radio's automatic gain control. Now, you can hear "dit-dah-dit-dit", instead of "hiss-hissss-hiss-hiss".
Old copies of the ARRL handbook (or old QSTs) I think had diagrams of this sort of thing.

Over the weekend, there was a "public safety" expo at the local mall. Got talking to one of the aux communications guys, after noticing some ham HTs on display. Mentioned about the discussion we had on this net about 6 months ago about hams using their modified HTs to contact police depts on police radio frequency. He said that we should *never* do that unless it is an extreme emergency (where someone is about to die, like in a car accident) and you have tried all other methods of communications (like the ham repeater, knocking on house doors to get them to call the police for you, etc.). The FCC may say that it is OK, but the police will not like it, unless it was an extreme emergency, and you tried other methods first (and they still won't be happy).

Which works even better if you use two or more wires on each side of center spread a foot or more apart at the ends. It then approximates a biconical dipole, which doesn't have the extreme feedpoint impedance variations of the single, thin conductor version. That makes the job of the tuner at the radio end of the ladd line much easier.

I have a friend who tried 4 wire ladder line. Works even better than the 2 wire kind. The line radiation losses are much less than all but the most expensive co-ax. He tells me that in the hills of Kentucky, where he lives, people living at the bottom of a hill put their TV, CB and ham antennas on top of the hill and run 4 wire lines several hundred feet to the bottom of the hill with great success.

In helping the wife of a local silent key dispose of his shack, I have come across a new (unused) Jennings Radio vacume variable. It is a double (gang?) cap with a chain drive linking the two sides. THe entire unit measures about 18" x 18" x 4". It is marked 15,000V and T85Q?A25060 (some digits are blurred and one is unreadable).

Does anyone have an old Jennings Radio catalogue? WHat did this thing cost new? What do they go for in flea markets these days?

Thanks for any info.

Yes, you can build simple receivers and transmitters that work well enough to make lots of contacts on the air. Direct-conversion receivers have the advantage that the local oscillator can be used as the vfo for the transmitter.

On the other hand, the time spent building, testing and troubleshooting the equipment adds to the time before you can get on the air. And you can spend lots of time and never get it working properly which can be very discouraging. I recommend you buy some used equipment to get on the air. For $100 or $200 you can buy a HW-101 with all needed accessories. Now at least you can get your feet wet transmitting while you experiment building equipment.

I have a surplus tuning capacitor whose worm drive and anti-backlash
gearing is pretty gummed up with grease that has gotten some grit in
it. I'd like to remove all the grease and grit and replace it with
new clean grease. I have two questions:

1) How should I remove the old grease? I could dip just the gears in a
solvent of some sort without exposing the capacitor itself. What
solvent do you recommend?

2) What sort of grease should I use to replace the old?

Hey! The 710 is the very animal that I have. (Eico 710, 8 bands from .4-250 MC)

Any one have any hints on how to create and tweak coils for this animal? Pretend I don't know anything about building resonant coils for dip meters, and you won't be far from off. (I have had a lot of work with resonant loads, from antennas to resistance networks, but have never worked with dip meters - perhaps I would have been more successful if I had)

Thanks.

swood

I was refered to this group by some on reading another group I had posted this in. I am in quiring about a British made radio for the 1947 Bently Mark VI. It's frequencies are measured in metres and it was made from 1946-1951. I have info on who rebuilds these things but I also would like some technical info should I want to rebuild it my self. Can anyone help.
Thanks!

What about buying older tube-type gear and then rebuilding it?
There are some excellent tube-type rigs out there (Collins, etc.)
that you could buy and repair. IMHO, it would be much less trouble
than building from scratch, although a successful homebrew IS very
satisfying.

Anyone out there ever built their own capacitors? I need a few
ufd (maybe 2-10?) at 10-20Kv, with low impeadance. I'd rather
avoid oil dialectric (messy) if possible. DIalectric suggestions
welcome.

I also need a good, fast high-v switch, something easily obtainable that
won't require a license (:)). I'm contemplating building my own
triggered spark gap switch using a trigger transformer...

Robert Carpenter <rc@cmr.ncsl.nist.gov> makes the following points...

> NO-CODE LICENSEES LOWER TECHNICAL LEVEL IN GREAT BRITAIN
>
> 17. The experience in Great Britain seems to disprove the contention by Philip Karn, Brian Kantor, and others, that a no-code license would bring in many highly technical amateurs. The British have had a no-code, VHF-and-up license for more than 25 years. It has the same written exam as their full license. I understand that there are approximately equal numbers of no-code and with-code licensees. I have totaled, by license class, all of the authors of all the technical articles in all the 1989 issues of Radio Communication, the most important British amateur radio journal. There were 57 technical articles, 3 were written by no-code licensees, 4 were by foreign hams (most/all held full licenses) and one was written by an unlicensed person. The other 49 were written by full-code (12-wpm) licensees. In fact the authors of over half the papers (29) were licensed before 1964, the date the first British no-code license was issued, and thus could not have even entered amateur radio by the no-code route! If 50%

See later comment about RSGB being elitist clique

> of the British amateurs are no-code licensees, yet they write only 5% of the technical articles, I conclude that the British

How does the saying go? 'Those that can, do; those that can't, write'

> no-code license is a refuge for less-technically-capable people,

I feel insulted by the above statement. I do not consider myself 'Less technically capable' just because i am unable to behave as a rather inefficient modem!

> even though the minimum entry level is set by the same written examination as for their full license. I doubt that a no-code

The RSGB only represents about 1/2 of the amateur population in the UK. Many UK Hams consider the RSGB to be an elitist clique.
The 'Technical articles by no-code licensees' are ghettoised into the Packet and Microwave Newsletters (available at extra cost!) and so will not appear in the citation-counting referred to above.
The RSGB do NOT represent the whole of the UK ham population by

any means.
(BTW, I am a member of the RSGB; trying to change the organisation
from within)

>
>25. While researching the technical level of no-code licensees in
>Great Britain, I came across a requirement of the British licens-
>ing regulations that must become part of the US regulations,
>should the Commission adopt a no-code license. The British

But you dont *HAVE* to slavishly copy *ALL* our mistakes!

>correctly assume that, since their no-code licensees have not
>demonstrated their knowledge of the Morse code, the code they
>send may be unreadable. Thus, the British require no-code licen-
>sees to identify their code transmissions by voice. This means
>that no-code licensees may only use code in those band segments
>also authorized for voice.

There are no such 'Voice-only' bands in the UK!!.
The 'band plan' is entirely voluntary. We are allowed to identify
using voice *OR* Morse (and are required to do so when operating
Packet/SSTV/RTTY/FAX *IRRESPECTIVE OF THE CLASS OF LICENSE HELD*)
To us Europeans, the idea of 'CW-only', 'Voice-only' etc subbands
looks like restrictive and Stalinesque behaviour by the FCC.

IMHO, denigrating us no-coders because we fail to write/publish articles in
RADCOM is false... Are you similarly going to denigrate all those who are
involved in radio but who dont hold Ham licenses as being 'second class
citizens' because they dont take the Ham exam?
I fail to see how learning CW would in any way further my ham radio interests
since even if forced to learn it, I would be unlikely to ever make use of it.
(Machines are so much better at reliably copying digital data, whether it
was originally generated by man or machine ; damn it, they can even do it
when i am not there!).
Why should i have to be a modem? You might as well expect me to generate
RF direct without the intervention of electronics.
(Maybe that will be the next thing in incentive licensing; proven
ability to hold QSOs by telepathy?)

Pete Lucas G6WBJ PJML@UK.AC.NWL.IA 0793-411613

Excerpts from the ARRL handout on operating in Mexico
[dated June 1988, approx.]

The United Mexican States has not entered into a reciprocal licensing/operating agreement with the United States (though the two countries share a third-party traffic agreement).

Mexico, however, issues operating permits to U.S. amateurs on a courtesy basis. Upon arrival in Mexico, visit the nearest Delegacion Regional de Concesiones y Permisos de Telecomunicaciones. There are many offices througout the country, and a list of them is available from the ARRL Regulatory Information Branch for a business-size SASE.

You should take the following:

- A written request for a temporary operating permit, which contains information on your equipment, address in Mexico (friend or hotel/motel) and automobile.

- A copy of your tourist card or visa (issued free of charge by the Mexican consulate located in many U.S. cities or by the immigration office in Mexico).

- An HD-1 tax receipt for a license fee (37,000 pesos, or $26, as of September 1987) paid by you at the nearest Office of Secretaria de Hacienda y Credito Publico.

- A copy of your FCC license

[stuff deleted]

Guest operation by foreign amateurs of XE stations is permitted.
[stuff deleted]

Phone patch operation is discouraged except in emergency communications.

The following are editorial comments by KB0CY (based on talking to several US amateurs who hold XE licenses)

* The actual procedures seem to vary, depending on where you are

in Mexico.

* The license is good for the same length of time as your tourist card which is usually 6 months. It is not easily renewed -- it requires the same fee & hassle all over again.

* It takes about 1/2 day to obtain the license (if things go well).

* The latest info can be obtained from the ARRL for an SASE.

* Contacting a local amateur or someone who has obtained a license recently is very helpful.

I am offering to anyone who has a Commodore 64 or a Commodore 128 and a Pro-2005/4 a program that will help you keep track of your scanner memory. The c64 version is compiled and runs as fast as the C128 version in 2Mhz. If anyone is interested send E-Mail directly to me and we'll make arrangements for transfering the program.....Both are rather short (about 25k),
but offer features that a program of such nature should include. They are being released on the shareware concept. Since I am not able to keep up with this newsgroup, I am asking that all responces are directed to me.

Thanks,

Tony

Was wondering if anyone in net-land could help me with this.

I have packet station consisting of a MacSE, AEA PK232 and a Kenwood 731A. I'm trying to get the ka9q TCP package to work. The software starts up fine on the Mac - no problem. But, I'm unable to make any connections. Specifically, my first attempt, as a test, was to try to get the AX.25 protocol to work to connect up to my local Net/ROM node - CAPRA (Chicago Area Packet Radio Assoc.)

The ka9q software will not key the transmitting and I'm stuck in a "connection pending" condition. I have some thoughts on this and think the problem is that I have not entered KISS mode on the PK232 with the correct parameters.

As far as "nornal" packet operation is concerned... evertthing works fine so I know I have the connections (cables) set up properly.

I have PK232 firmware dated 19.Jul.90. The Tech manual gives a set of instructions for what paramters need to be set before going KISS. The 19.Jul.90 firmware revision says all I need to do is say "KISS ON" and warns that entering KISS mode sets certain parameters.

So, if anyone out there has any insight on this - I'd appreciate it. If anyone has a PK232 and a MacSE running ka9q ... can you verify that in fact this works... or does not work... or disclose the incantation that will make it work.

Thanks,
  Gary (New packet user)

I currently have an ICOM R70 connected to a 70' wire antenna and am wondering what is the best step to take toward a better antenna system. The choices that I've considered are the following:

1) Get an antenna tuner and use it with the 70' wire.

2) Get an antenna with traps (Alpha Delta Sloper).

3) Cut my wire antenna to the most useful length for the broadcast bands (vs HAM bands where it seems that 66' is a popular length).

What I'd like to know is what are the advantages/disadvantages of each option and which one will get me the most bang for the dollar?

Also, what do others do about protecting their radios from spikes from the antenna caused by static electricity and lightning?

Thanks in advance.

```

>collisions they are always quite noticeable and they're using FM...

From what I remember, most narrow band FM receivers will capture only
one of the transmissions if it's approximately twice as strong as
the other (3dB).  If it's more than 3dB down, the interfering signal
may still cause some distortion of the stronger signal, but to a lesser
degree.  The weaker the offending signal is compared to the stronger
signal, the less noticible the interefernce will be.

In your local police example, the various officers are almost
always within DFQ range of the repeater, so typically collisions will
be heard since the signal strengths are relatively close.  In an
aviation situation, one plane may be nearing the runway while
another is 100 miles out.  In this case, the nearby plane would
probably totally mask the other on FM, but on AM, there would
still be noticible distortion.

norlin@uokmax.ecn.uoknor.edu (Norman Lin) writes:

> Is it realistic to expect to be able to have any communication at all with, for instance, a one or two transistor crystal oscillator? In almost every publication I have seen, a crystal oscillator is shown as the simplest "transmitter," but no indications of actual useability are given. Has anyone out there gotten reasonable performance out of a one/two transistor oscillator?

You can have quite good results with power outputs in the 100 mW to 1 W range; easily obtained with a couble of transistors. Crystal control is easier to design and get stable operation with, but it really isn't that much more difficult to get a VFO running.

> On a similar note, is it feasable to build a useable (in terms of CW selectivity/sensitivity) simple receiver? (For me, "simple" means the circuit diagram will fit easily on one page -- a couple of transistors and IC's.) I have experimented very briefly with a regenerative circuit but it left much to be desired.

Don't bother with the regenerative receiver, except as an exercise in history. The simplest receiver is the "direct conversion", and while it has it's drawbacks, it is entirely usable.

Be careful that you don't set unnecessarily stringent performance requirements for your rig. It is nice to have a real hot-dog high-tech multiband transceiver with 120 dB 3rd order IMD, 250 Hz CW filters, 1 Hz resolution synthesized VFO, etc., but neither you nor I can afford one of those. To compensate, I have occasionally set as a goal something like this:
"Design and get working the cleanest 40 meter CW transceiver possible, using less than 100 mA @ 12V, and fit it on a 3" x 5" circuit board."

This gets me on the air, and instead of feeling ashamed of my rig, I am (justifiably) proud of it. Just get on the air!

One of the best sources of information on homebrewing (especially small-scale homebrewing) is _Solid_State_Design_For_The_Radio_Amateur_ , by Wes Hayward and Doug DeMaw, published by the ARRL. The cover price on my issue is $12.00, and it has more usefull information than most $50.00 textbooks. _The_ARRL_Handbook_ is also an essential source for the homebrewer.

If you, (or anyone else,) would like to brainstorm some more on the topic of homebrewing, let me know. My "hot buttons" are SIMPLICITY, ELEGANCE, SMALL SIZE, LOW COST, and the ever elusive WOW, THAT'S *NEAT!* factor.

+
+Speaking of mysterious carrier signals, how about the one at 28.636?
+It is the 8th harmonic of the TV colorburst frequency. Those TV sets
+that surround us are quite strong even at the 8th harmonic.

Just wait 'til digital TV comes out in a big way! The digital system clock will be a harmonic of the 3.579545 Mhz colorburst freq. So, you'll hear

7.15909
10.738635   (should be interesting for FM bc radios!)
14.31818
17.897725
21.47727
25.056815
28.63636

TVs with picture-in-picture have digital circuitry (you need a digital memory to store the info, it's a FIFO that operates at erattic speeds and delays).

One thing that should help us some: the 16th harmonic of 3.579545Mhz is in the middle of TV channel 2 (57.27272Mhz). So, the TV will need to have its digital stuff well shielded so you could watch channel 2.

In addition to the other comments, I'd add that the Hallicrafters you made your tests with probably has no noise blanker. I would expect the impulse-type noise from the corona to be a good candidate for elimination/great reduction by a noise blanker. In fact, you might want to see if you can get your hands on some various modern radios with blankers to try: some are much more effective than others...

But if you've got a working grid dip meter, you can tell him the inductance of the taps on the coils; just clip a capacitor onto the taps and measure away with ... a grid dip meter. Since the things are low frequency coils with the inbuilt tuning capacitor (circa 50 pF), this will likely require using either another grid dip meter, or measuring only the higher-frequency tapped coils ('cuz you're unlikely to be able to estimate the stray capacitance better than a large fraction of that 50 pF.)

The inductance, of course, goes as the square of the turns ratio.

Anybody care to venture a guess what transmission mode will be most successful just after the initial EMP ? No... It couldn't be ... HF CW ? Gak. That's even scarier than The Bomb itself.

It certainly wouldn't be packet, because all the digipeaters on those high hilltops will have had the smoke let out of them. Ditto for VHF NBFM repeaters.

More serious question - assuming high atmospheric ionization, which band comes back first ? 160 meters ? Will UHF/VHF simplex work first ?

Rather than "nonresonant", I prefer to think of a fat antenna as "wideband".
Radiation characteristics are unchanged by L/D ratio.

Re: aperture

If you're concerned about capturing more microvolts at 70 cm, try a more
complicated antenna, like a center-fed 3/2-wave, loop, or collinear design.
All have better gain than a dipole.

I don't think that what is meant is to cancel it. Propagation will be
totally disrupted, and cancelling won't be necessary.   Probably tyhe only
radio contacts would be by very low frequency ground wave propagation. But
you have a good point in that within a short time the point would become
moot following a full-scale nuclear exchange. World powers are aware of
this and are gravely concerned about it, botu I'm not so sure of "emerging"
and third-world countries. Are there any ham bands below 100 kHz?

I don't know what to do for a few uF, but if you're after a few hundred
pF, I can recommend teflon printed-circuit board. (Don't use
regular epoxy board for high-power RF; the losses cause enough heat
to burn up the board.)

Etch the copper a tenth of an inch of so around all the edges so it
won't flash over. If you need over a few hundred volts of RF, you
will have to coat the board with an anti-corona material. Spray
it on to avoid bubbles. Best is high-voltage paint ("dope"), but
I seem to remember that hardware-store spray paint works well too.

If you ever open up a Drake MN-2700 kilowatt antenna tuner, check
out the fixed HV capacitors mounted under the "bread slicer" variable
caps. They are constructed this way.

It was one of the Thomson "Tommy Rockford" series of ham radio novels
for kids. I think the grid-dip episode occurs in "DX Brings Danger".

There are 3 or 4 of these books, all available from ARRL.

Get some 0.75" OD plexiglass tubing and cut it in 2.5 inch lengths. You'll have to use some ingenuity in fabricating pins to fit the socket on the end of the grid dip meter. Heavy solid wire, like some tinned 12 AWG may be about right.

The grid dip meter is tuned *solely* by the inductance of the coil; there is obviously no bandswitch on the instrument. While the 3 lower frequency coils may be tricky since they are tapped and I cannot estimate the turns, the higher frequency coils from 2.9 MHz to 250 MHz should be easy to build.

Just start with winding a coil based upon the description in my previous article. All you need to test is a sensitive frequency counter. Set the scale on the grid dip meter to a given frequency. Take the test leads from the counter and loosely wrap a turn around the coil form for inductive coupling. Merely add or remove turns on the coil until the grid dip meter calibration matches the reading on the frequency counter.

These coils, by the way, are not exactly hi-Q, so I wouldn't sweat your fabrication technique.

I can't do much more than tell you the above.

ajs@hpfcdc.HP.COM (Alan Silverstein) writes:

>> Do I have to know Morse code or has that changed?

>Yeah, unfortunately, 5WPM.

Actually, no. You have to pass a 5 WPM test, but that has little to do with actually being able to copy code at 5 WPM. Here's what you do:

Learn as many as you can: E, T, R, I, N, O, A, and S is a good start. Also learn the numbers pattern.

During the playing of the tape, write down the dot-dash sequences, rather than the letters. The tape goes so painfully slow that this is actually a workable strategy.

After the tape is over, you have as much time as you want to play "fill in the blanks." Fill in the ones you memorized, then try to figure out some of the words. "T _ E" is likely to be "THE". Then if you find the same pattern as the "H", try putting an H in those other spots as well.

Most VEs give you a choice of passing by 1 minute of solid-copy, or getting 7 out of 10 on a multiple-choice content quiz.

Using my "learn 8 letters and bulls__t" method, 5 out of 6 people I've recommended the method to passed on their first try. The remaining one did it on his second try. Can any of these guys work CW? Probably not. All of them immediately went on to Technician and are 2 meter and packet operators, so they really could care less.

Is this against the spirit of the rules? I suppose. Is it illegal? Heck no, unless the FCC decides to change the test requirements. Is it blasphemous? That depends on how much flame-mail I get from this post, doesn't it? :-)

My stance on no-code? Two licenses: Technician and General. Technician has a 50 question mostly rules test, but grants no HF privs. General has a 12 wpm code test and a 20 question mostly theory test, and grants current Extra privs. The ARRL would probably freak, but anyone who's seen my QSL card knows what I think of them... :-)

Well, let me mosey on over to the fire extinguisher and don my asbestos long-johns...

I know of someone who has the European version of the ICOM 2SAT
handie talkie and was able to modify the receiver to go from
80 Mhz up past 174 Mhz by reseting the uP. He did this all from

the keypad. When tried on the American version - no go.
Can anyone tell me if this Rx mod is possible on the American version ?

Tnx,
Rich

ZCZC AP43
PROPAGATION FORECAST BULLETIN 39 ARLP039

AMERICAN SUNSPOT NUMBERS FOR SEPTEMBER 13 THROUGH 19 WERE 163, 182, 152, 137, 128, 119 AND 131 RESPECTIVELY, WITH A MEAN FIGURE OF 144.6. SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE 194, 206, 203, 200, 205, 203 AND 208, WITH A MEAN FIGURE OF 202.7. AR

Has anyone collected a complete database of sunspot and solar flux numbers they could share by posting here or via Email. I'd sure appreciate it.

I'm interested in the recent data for planning HF operation along the 28 day cycles. The past years information would be interesting to correlate with my successes and non-successes on 10 meters.

Thanks.

-Steve Schallehn, KB0AGD

For the past month I've had the second port of my KPC-4 connected to a scanner with one of the 16 channels set to 145.825. It's a pretty lousy way to copy packet but what the heck - the second port on the TNC isn't being used until my 51.7 Mhz xtals arrive. One morning DOVE was coming in loud and clear - actually woke me up. That was the only time a "DOVE-1" showed up in the "heard" list. It was sure a thrill to see the callsign from space.

>>> Can I build a simple rig ...

There are many QRP rigs (mainly CW) whose schematic will fit on a single page. A good source of these and many other homebrew ideas is SPRAT - the journal of the G-QRP club.

As an example, here's the Table of contents from the Summer 1990 issue (it's published quarterly):

AF Preamp & active filter for NE602 Mixer
28MHz Transmitter (with four transistors)
An SMD (surface mount devices) Iambic Keyer
One toroid AF Filter (giving LP, HP or Notch responses)
Disco Display (an ATU with a visual display)
Varicap VFO (with PCB artwork)
Surface mounting VFO & Source Follower
Surface Mount technology - Ham style (on the virtues of dead
bug/ugly construction)

Suitcase Magnetic Loop for 40 - 20m
Huff & Puff Revisited (a simple frequency locker for any VFO)
QSK for CTX80
A Battery & SWR indicator with a Duo-Led
Quality Audio Amplifier for Receivers (with artwork)
AGCW Contest
Communications forum - SSB, VHF and Members News

Of the 44 pages 28 are constructional, 8 are members news ... and 4 are ads, 1 editorial and one of upcoming conventions.

This is one journal I really look forward to getting - the editorial policy on articles is something like "draw a circuit and outline how it works, we'll take it from there". The now has over 4500 member worldwide.

Annual Subs are US$10 or five Pounds.

For more info, write to:

Rev George Dobbs G3RJV
St Aidans Vicarage
498 Manchester Rd
Rochdale
Lancs OL11 3HE

I think at this point it should be emphasized that you should NOT
get your feet wet transmitting.

This poses a severe shock hazard.

I am planning on building a low power AM transmitter to operate
a radio station in my area.

1) What is the legal limit of wattage or whatever a person
can broadcast at without an FCC license?

2) Does anyone know where I can find schematics and plans
to do this?

thanx,

gristle@ucscb.ucsc.edu

Yes FM is used in aviation, but not directly for ATC purposes, and not in the 116-136 MHz band. The are a number of devices on the market, mostly used in non-US areas, which are basically cross-band repeaters. These serve two basic purposes. First, they can relay tower comms to a remote AM transceiver rather than run phone lines up to a hilltop. Secondly and more common, they are used to allow ground crews parking, servicing, etc, the aircraft to hear and/or talk to the aircrew. Check some commercial publications, international trade journals, JANE'S, etc for info on these. I know Motorola does make a cross-band repeater controller for this purpose, but for international sales only. I have seen others also, but don't remember where I read about it.

I have been in many towers, and have worked on ATC radio and console equipment for many years. I know a lot of controllers and a lot of pilots. Very few have been incredibly technical. I found some controllers who were flabergasted when they found out that their radios were not located in the console, and even more astounded when they found that some were many miles away. To talk about FM/AM to some of these folks would not be much different than talking the difference between a Saturn V and a V-2 to the average five year old. (Before you turn up the heat, this is not to imply that controllers and pilots are stupid or lack intelligence. technical aspects of the equipment is simply not their required area of expertise, and they simply lack the information. I generally (:-)) have a high regard for both pilots and controllers.)

Next time you have time to kill at an airport, look up the maintenance folks and spend some time with them. They can usually show you the equipment and talk smartly about it. You will probably surprise them. Everyone wants to see the tower, but no one ever wants to see what makes it work.

73, Michael

Try the "QRP Notebook" and "Solid State Circuits for the Radio Amateur", both published by the ARRL. Lotsa interesting stuff in there. I'm planning on trying my hand sometime soon at building a simple single-conversion superhet that uses a 1-pole crystal filter in the IF section. (I think that circuit is shown in the latter of the two books.)

Last week I came accross UA4RZ working large numbers of people DXpedition-style and announcing "Kazan new Soviet republic--probably new DXCC country". I couldn't pull the explanation for this out of Gene, but did a post to talk.politics.soviet the next day. I just saw the following reply (from Moscow) in t.p.s. concerning the "Kazan Republic". Next the DXAC will probably bring up a motion to discuss consideration for appointment of a study committee, etc., etc.

A friend recently purchased a new R-7000 complete with the computer
interface, and is now wondering what software is available (purchase,
share-ware, free-ware, etc.) to do the controlling. E-mail and/or
FTP-able sources would be prefered, but USPS would be OK as well.

Please e-mail to me, and I'll summarize to the list later.
Thanks in advance.

Well, I've decided to join in on the fun and purchase an HT.

It seems that a lot of you out there already have an HT and I can't think of a better place to ask for opinions. ;-)>

I've narrowed down my decision to the IC-24AT and the FT-470. Both of these look like real whiz-bang little toys. The FT-470 is a lot cheaper, but a little bigger, and heavier. The IC-24AT can do amazing things with a few mods but would lighten my wallet quite a bit. So which has the most bang for the buck?

If you have experience with either of these two babies, I'd really appreciate it if you would send be a note on what you think. I'll post a summary of the results.

Thanks in advance,
-Tom

My favorite scene from the movie, _Die Hard_:

The bad guys had h-t's on the police freq. The hero, a cop from another town, managed to capture one and call for help. The police dispatcher gave him the runaround, announcing that the frequency was for emergency use only.

He replied, "No s***, lady! What's it sound like I'm doing, ordering a f***ing pizza?"

I have the 470, and I like it. The 24AT was too much for my wallet, anyway. With the correct key sequence, the 470 does cross-band repeat (though I don't need this very often). I do use ALL the memories on 2M, and about half of them on 440. The 2M receive opens up easily to 130-180 MHz, thus several of the memories are police, fire, NOAA, etc. A buddy put the rig on his $10k service monitor, and was astonished at how hot the receiver was. < 0.1 uV at 146 meg. Lighted keypad is nice, though I sometimes wish the lamp button was push on - push off instead of momentary. Dual-band rubber ducky works well. It would be neat if the 440 receive could be extended, but I haven't seen any postings of such a mod.

Some 470 users report intermod problems in high-RF environments; I don't often have that problem, but I hear that Yaesu will do a free mod for those that do. It allegedly involves moving one of the IF's and realigning. The new ones probably don't need the mod at all (already done at the factory).

Signal reports have been consistently good with this unit, and it's built fairly small but solid. I use the 7.2V 600 mAh (FNB-17) pack and the stock vinyl case. Around here, I almost always use lo power, and battery life is very acceptable.

Biggest drawback to this rig is the miniscule speaker. I frequently use an earplug, even inside a vehicle. Maybe someone would be interested in working up an audio-boost mod! :-)

Hope this helps. 73s!

```

FT470: better usage of the computer.
- uhf rec coverage doesn't seem easily expandable
* memories can be programmed with separate tx & rx freqs which supports any odd-ball offset you may run into.
* recalled memory can be tuned without having to switch back to vfo mode
* pl decode freqs can be tuned thru while receiving, if you are nosey
* true dual receive, tho I usually leave it off.
* lighted keypad (I miss this on the IC-24)

IC-24AT: can't do the 4 * above
- boneheaded programmer of computer made the tx offset step 25khz, instead of a more usable 5khz
- viewing angle of lcd display is narrow
- small, recessed keypad harder to use, especially if you have big fingers, and also if it's in the dark.

* more ruggedly built (my impression..)
* very wide expaned rec range (varies with each radio, however) I get <2uV sense 118-135,138-178,335-485,800-960Mhz
* it is cheaper.

My observation is that Yaesu makes much better use of a computer, while skimping on the ruggedness factor, while Icom makes it more drop-proof and hires brain-damaged (or fired Yaesu) programmers.

I bought an FT470 some time ago, I do notice, even after the factory mod, that it is very prone to intermod. But that is a fact of life for any hot, wide coverage receiver in the L.A. basin.
I recently broke down and got the IC-24 thinking I would sell off my FT470 and while I grumble about the shortcomings of both, each has something I like (but not in common), so I'll probably just keep both handy.
I suggest, if you want wide freq coverage and can live with the price and shortfalls, get the Icom....If you want good ham-band functionality and less pocket-picking, get the Yaesu. Or, like I do, ignore any advice and get what you like...

Back in the war days, the enemy would over-run our comm outposts and we would lose all the equipment and write it off. Later, the good guys would over-run their comm outposts, and we would get our equipment back. Since it was already written off, it was brought back to someplace friendly (?) and placed in the botom of a hole and covered up with a bulldozer. We would then go over and dig up the pile looking for goodies. Within a years time, I had quite a few KWM-2As with all the accessories, etc.

What has this to do with cleaning capacitors? If you were put in a hole and covered up by a bulldozer, then uncovered some weeks later would you be very clean? Anyhow, off to the shop with our prizes. Take out the tubes and a few other frailties and into the mop sink full of good old hot water and dish soap. Today, I suppose something like Dawn which cuts grease real good would be OK. Slosh it around good and take it outside and hose 'er down for the rinse cycle. Hang it up by a chain outside and dry in the sun. A little shot of Lubriplate or your favorite greasy stuff in the bearings and your good to go.

I figure with all the scroungers in the shop, we must have done this to several dozen KWM-2As and bunches of other stuff. Never had any problems that I remember.

Good luck and 73,
Michael

We once got a whole fleet of GE Pre-Prog 450 MHz FM mobiles from a construction company. Those things were DIRTY!

Of all the methods that worked, the best one we found for cleaning them was to take all the tubes out and run the rest of the radio through the dishwasher. We'd stop it before it got to the DRY cycle, then take the radio out, shake the loose water out of it, blow it out with compressed air, and stick it in the kitchen oven (electric) at 130F for a couple of hours to bake dry.

Tuned them up and there it was. Never had a problem.

Motorola T-44s never survived that process. GEs didn't seem to mind.

Just noticed that Surplus Sales of Nebraska is closing out the AEA
DX-Handy at $159, which is about half what I paid for mine, long since
sold. A quick call dtermined they no longer have the 6 meter version
that I was after. Anyone know of anyone selling the 6 meter version?

Anyone know if the new dual band Kenwood, the TH-77, is available in the U.S.
or not yet. They're already importing the new smaller single band units (at
least they've been advertising them).

Also, does anyone have any mods for the Uniden Bearcat 200XLT?

Thanks.

Oh, that sounds like "SOS at Midnight", by Walter A. Tompkins (ham call K6ATX), if memory serves. I remember reading it in the early sixties when I was in junior high school. Later, I bought a reprint of the book from the ARRL (American Radio Relay League, Newington, CT) and reread it.

The author wrote a small number of other books similar to that one and they were (are?) also available from the ARRL. The ARRL was peddling them with the suggestion that they would make a nice gift for a budding young ham. (I donated mine to the local library).

BTW, the period of the novel was in the late 50's, judging by the hero's radio gear (a Heathkit DX-100 transmitter).

The Harris RTX-2000 is a RISC high speed Forth engine (no, that isn't an oxymoron in THIS CASE ;-) which has many of the attributes of a DSP chip. I won't go into the details here. It IS being used as both a DSP chip and as a disk controller on the ram disk on board.

This is part of the RUDAK experiment that was built by the AMSAT-DL RUDAK group in Munchen, Deutschland (Munich, W. Germany). This will be RS-14. It will be called Radio Oscar 21 after launch. This will be the first SU launched satellite done in conjunction with one of the `western' satellite building groups (AMSAT-DL/RUDAK) and with some participation after the fact by AMSAT-NA folks. The group in the SU, in the spirit of cooperation, etc. etc. have chosen to have it be the first satellite to join the OSCAR numbering scheme. Just as UOSAT-A is UO-9, RS-14 will be RO-21. Fuji-2 was FO-20 and this will be the next in line.

Bob

In the Boston area, DOVE has been making its evening pass around 9PM EDT -- you
may have to widen your listening hours to catch it. To get your TNC to show you
something, be sure and set PASSALL ON. I listened many times and got nothing
until someone tipped me off to PASSALL. (I did get lots of copy from (*ahem*)
people trying to connect to the DOVE though -- I'm sure it was an honest mistake
on thier part.)

>Try Shunt Feeding your Tower!?

You must be a rocket scientist :) I've only heard stories about people doing this.... Neat stuff, though.

>I could think of big ferrite cores but where can I get cores
>that are big enough for RG-213?
>
>Any other ideas?
>
>73 Ben, DL6RAI

Maybe all the control cables on the tower are hot with RF. Try ferrite on ALL those cables before it goes into the shack. There should be a way to use a dip meter in absorption mode to see what cables are hot. It could be that the RG-213 is getting shield currents because the match is on the top. Are there ways to put the match on the bottom, and have less RG-213 on the tower ? My experience with 2-meter J-poles is that any feed line close to an antenna will develop RF on the outer conductor, which must be choked. Otherwise, you get screwy SWR depending on cable placement, not to mention less-than-clean patterns.

There is a linear choke described in the ARRL Antenna Handbook (or maybe the Handbook itself) that consists of a long mailing tube around the coax. The mailing tube is then stuffed with steel wool. Another possibility is making a choke out of a bunch of RG-213-sized cores - there are references to "bead baluns" in the Antenna Handbook. That sounds expensive, though.

Another possibility is to eat the .1 dB loss and use RG-8/X or (gasp!)
RG-58/U on the tower or for the choke section.

Good luck. I'm amazed to hear of people actually shunt feeding a tower !

I was unable to mail to you direct. Please respond to this note in
order to acknowledge receipt. Otherwise I'll try other methods...

Ken...

Hi Bob,

Primary repeaters in the Colorado Springs area would include:

146.97 (Pikes Peak) {wide area coverage}
147.03 (Cheyenne Mtn) {open, but with private patch facility}
147.345 (Cheyenne Mtn) {open, but with private patch facility}
146.910 (location?)   {open, Springs link to "Colorado Connection"}

In addition, 146.52 is a very commonly used simplex channel here.
Your best bet would be the '97 machine as most of the locals use it
a great deal more than others. In emergencies, you may be able to
get a member of the two patch machines to dial for you. They are
usually happy to help out.

The Colorado Connection is a system of linked repeaters throughout
much of Colorado. System quality is marginal-to-adequate, but use
is free.

If you are able to spend some extra days I would suggest taking the time to drive up Pikes Peak (14,110'), drive through the Garden of the Gods, or out to the gold camp of Cripple Creek. There is good shopping along the main street of Manitou Springs. This time of year is also the primr time to observe the aspen trees turn their fall colors.

Hope to here you on the air...   73 Ken

I agree that programs should go to the existing binaries groups. Now with that out of the way, I don't see the problem with mailing lists other than the volume running up the phone bill. At least at my site, I can read mail one page at a time with mailx or I can save without reading the mail to the mbox and use vi on the mbox to read the parts I want to read. I save out the parts I'm interested in and delete the rest. Surely anyone with any reasonable Email system can do the equivalent of this.

Since making a request for information on the Alinco DR-110T 2m mobile transceiver, I've received a couple of requests to post any comments I receive. I got three responses from hams who have first-hand experience with this rig. Comments were very favorable on the whole. The only problems indicated were susceptability to intermod in high-RF areas (but no more than similar radios from other manufacturers) and difficulty in seeing the LED display in daylight.

The comments were favorable enough that I drove up to Ham Radio Outlet in Burlingame to get one. They had the DR-110T on sale for $289.99. I also found the DR-112T (same as the DR-110T but with an LCD display) for $319.99. I decided that being able to see the display in daylight was worth the extra 30 bucks and walked out with the DR-112T.

The radio is nice and compact. I haven't had a chance to hook it up yet so I can't vouch for its performance. If anyone's interested, I'll post a review of the radio after I've given it a workout.

By the way, one of the hams who replied to me gave me the mod to get extended coverage. I assume that it has probably already been posted here so I won't repeat it unless I'm requested to do so. I won't try it myself until I'm satisfied that the radio is fully functional (wouldn't want to void that warranty too soon).

> I am trying to find out the QSL information for N1HAQ.

Likewise, since you raised the question, I'd like the address for N4YVP. He said he was in the callbook, but he's not in the 2/90 on-line copy I have here, and I don't have the paper supplement. I promised a postcard...

Now this is a silly question to bother the whole Net with, so... how about only bother to answer (by mail) if you have the supplement AND you are in region 4? That should narrow down the responses. Thanks!

(From now on, I ask WHICH CALLBOOK?)

In article <1366@eastman.UUCP> harding%b56vxg.dnet@kodak.com writes:

>I am a new Ham and am getting my feet wet in the VHF and UHF sandbox. I have converted a TV rabbit ear to a 2m dipole which seems to work fairly well. (Anything is better than the ducky which comes on the IC-24AT.) So now I want to build a 70cm dipole and thought the same approach would work. But I have some questions which were not answered by the HANDBOOK.
>
>1) I have been told that the overall length of the antenna should be the half-wave length, yes?

The overall length of a half wave dipole is approximately a half wavelength. There are other effects that come in to play, end effects, etc, but basically it's a truism that a half wave antenna is a half wavelength long.

>2) At what point does the o.d. of the antenna elements become significant WRT frequency?

The rule of thumb is that while the length to diameter ratio is 1000 or greater, the diameter is unimportant except in a structural sense. As the antenna becomes "fatter" than 1000/1 the bandwidth increases. Eventually this can reach a point where the resonance peak becomes so small that you have a nonresonant antenna for all practical purposes. An L/D of less than 10 would be an example of a nearly nonresonant antenna.

>2) What is the relationship of the distance between the feedpoints to anything.
>4) I read somewhere that the 70cm antenna has a much smaller signal collection area, so a dipole isn't a good idea. That a multi-element beam is better simply from the standpoint of "collection area".

If the feedpoint separation becomes an appreciable fraction of the length of the dipole, say 5% or more, then the directional properties of the antenna will change. On the subject of capture area, given two dipoles, one cut for say 100 Mhz and another cut for 200 Mhz, the 100 Mhz antenna will present twice as many microvolts at the feedpoint than the 200 Mhz antenna for the same transmitted strength. This is because the 100 Mhz antenna is twice as large and intercepts twice as much of the wavefront. Signal "path loss" is said to be inversely proportional to frequency due to this effect. If you erect two dipoles side by side in a broadside array at 200 Mhz, their combined feedpoints will deliver the same number of microvolts as the 100 Mhz antenna, neglecting matching losses, while being the same physical size.

Similarly, a classic yagi of two elements would intercept the wavefront twice and give the same result. There is one fly in this ointment however, the radiation pattern of two half wavelength sections will be different than a single section. The antenna pattern will become more directional as elements are added, exhibiting "gain" in a preferred direction. This gain will be proportional to the physical size of the antenna array. The actual physics of antenna radiation is more complex than this, but this is a convienent way to think about the situation.

Re: dipoles

70' is almost ideal for a 1/2-size G5RV. It's mostly resonant, so you may avoid buying a transmatch. It is resonant on 40, 20, 15, and 10. As a novice, I don't think you can use 20 and 15 CW, but it gives you incentive to upgrade to tech. :)

The G5RV can be bought as a kit, but if you can find an Ernie, you can probably build one for free. If $$$ is a consideration, a transmatch can be built with the help of an Ernie. The commercial models, like the MFJ-949C are around $150 for transmatch, SWR meter, and dummy load.

Perry Scott
KF0CA

Ok Perry, I'll quit being so bashful and post this (some details may be inaccurate - but generally it should be close):

A Zepp antenna is a single section of wire a quarter wave (1/2?) end fed with open wire line. A douple Zepp is the same antenna with two sections of wire - one on each side of the feed line.

The standard G5RV is a shortened douple Zepp fed with a magic length of open wire line that (usually/sometimes) gives a usable match across most of the hf ham bands. The standard G5RV is 102' long center fed with 30-33 feet of open wire line followed by 50 ohm coax to the radio. It will match (with some trimming of the feed line) on 80, 40 20, 15 and 10.   The shortened size, multiple bands and lack of a tuner make it really neat.   By proper scaling a half sized version will work from 40 meters down. If nobody else has the exact dimensions handy I'll look them up and post them in a couple days.

Here's where I'm going to stick out my neck. The G5RV is a non-resonate antenna. It matches in the ham bands (i.e. provides a 50 ohm load) but is not resonate there. A true douple zepp antenna would be resonate (1/2 or a full wave) for the frequence of use.

It's possible to use a douple zepp as a non-resonate antenna by putting up as long of a wire as possible fed in the center with good quality open wire line.

The very-low-loss wire line is needed so the 1.zillion to 1 S.W.R. from the ludicrous mismatch of impedance between the feedline and antenna (at non-resonance) doesn't cause any significant signal loss. A high S.W.R. only causes losses by increasing the loss in the feedline. Open wire line has such low loss (compared to coax) it's effectively non-existant.

As a general rule the antenna length should be greater that 1/2 wave on the lowest band of interest. i.e. It should be over 130' for 80 meters up, over 66' for 40 meters and up, etc. At the higher frequencies (20, 15, 10) this antenna will start to show some gain. The longer the antenna - the greater the gain.

It can also be used at lower frequencies by tying the two ends of open wire line together and feeding it against ground as an end fed antenna.

The extended (very long) douple zepp is one of my favorite non-resonant antennas. I used to have one vee shaped, 40' at the top with 150' on each side. I fed this antenna with a real balanced line tuner (Johnson Matchbox). Cowabunga!

Also note that a Novice/Tech does have permission to operate cw on 15mtrs from 21.100 to 21.200. A really great band when it's open. Easy to work across the U.S. and DX, not crowded and only a short antenna is needed. I've actually operated on 15 with a 1/4 wave piece of wire (11') as a vertical plugged directly into the coax connector on the back of my transmitter and thumbtacked to the wall.

That's not recommended with uninsulated wire. And regardless of what the experts say - I wouldn't do that again with very much power - too much RF too close to the body.

And as for the original question about hidden antennas - I'd recommend a wire loop. There are two types: Use a balanced feedline (450 ohm good stuff or 300 ohm TV twinlead) with a tuner and make the loop as large as possible for a multiband antenna. Or cut the dimensions exactly for a single band and use a 1/4 wave matching section from 75 ohm coax. Most ARRL antenna literature has a 40 mtr full wave loop example that can be scaled to the band of interest.

Mount the antenna as high and as in the open as possible. I've had a 15mtr single band version made from a $1.49 pak of Radio Shack 22 gauge buss wire hanging from the upper to lower balcony at an apartment. It was nearly invisible and worked well. The third contact was Japan.

Another invisible antenna I've used was a loop of 150' of bell wire around the eaves of the house I'm currently living at fed with the plastic covered 450 ohm feedline run into a MFJ 949 tuner. It listened great. No contacts to report as I didn't staple it down very well and the winds blowing out of the Rockies disconnected the feedline and rearranged the antenna before I had a chance to use it.

Bill "Someday I'm going to really learn about antennas" Vodall
WA7NWP

p.s. Somebody ask Perry about the antenna he used to work Austrailia from a houseboat on Lake Powell, Utah.

Any antenna is better than no antenna. :-) If you can make the antenna full size and you have the typical wooden decking and shingles roof, then it should do fairly well. Unless your house is really long, you'll probably have to forego 80 meters. A shortened, loaded dipole won't work great in an attic. Try to keep the wire straight. You'll probably also suffer from RF induced in your house wiring and will have to do some suppression to prevent getting into all your appliances.

>   2. Anyone have any experiences (good/bad) with the AEA ISOLOOP

Others on the net seem to like this antenna. I'll let them comment.

Still true. If you're dealing with restrictive covenants here, you could be treading on thin ice. If someone did complain, you would be out a considerable sum to remove the crankup.

>   4. Any other good solutions out there?

A better solution is a disguise antenna. People have put up 66 foot metal flagpoles and proudly flown Old Glory while secretly transmitting to the the ends of the earth. I have never heard of a restrictive covenant that prohibits displaying our national symbol.

Another disguise antenna is a traditional long wire strung high in your trees made of thin magnet wire. This stuff will handle the power level you will be running and is practically invisible from the ground.

Help!
After being inactive for ~10 years all of a sudden this ICOM-735 shows up on my door step in a basket wrapped in a blanket (well almost).
Now this looks like a pretty nice little package and I'd love to use it but I live in area where VISIBLE external antennas are a no no and therein lies my problem. I've considered a few options to get back on the air which follow and I'd appreciate any and all comments from knowledgeable sorts as to feasibility, performance etc. by e-mail. If enuf responses are rcvd I'll summarize to the net.

1. Is an attic installed limited space antenna a VIABLE solution for 10-80 meters e.g. a trapped dipole etc?.

2. Anyone have any experiences (good/bad) with the AEA ISOLOOP either outside or in an attic?

3. In the problem description above I said VISIBLE external antennas. Is it feasible to install a 10-80 meter VERTICAL on a crank-up tower at the back of the house (against the house, not in the yard) and crank it up above roof line after dark?
I seem to remember that verticals require good ground radials still true?

4. Any other good solutions out there?

Thanks much and 73's

I was reading an article in Popular Science this morning about the attempt to circumnavigate the globe in a helium balloon. Apparently, the balloon, called Earthwinds, will be transmitting on the amateur bands. The article only mentioned this in brief and gave absolutely no details. Does anyone know what bands/freqs. the balloon will be using?

While you folks are digging back in your old QSTs looking for the earliest callsigns in the current series and all those other good things, can anyone tell me roughly how the total number of DXCC countries has changed over the years?   I've been on the air for 3 years from this country, and during that time there have been several new countries added (Aruba, W. Sahara, Rotuma, Unpronounceable Island [4J1], Conway Reef, Banaba Island, Walvis Bay) and no deletions (we expect some deletions soon, due to mergings of the Yemens and Germanies, just as we expect more new ones, but I think the official score in the last 3 yrs is 7 added, 0 deleted). Is this just statistical noise, or have new ones been added at a faster rate than others have been deleted? I know that the current total is 324, and an article in QST earlier this year suggests that another 50 have been on the list but are now deleted.

I think it's obvious that regardless of the DXCC rules, there have been more 'political' countries created over the last few decades, by declaring independence, than there have been deletions by mergers or conquest - and while we are talking trivia here, Namibia was the 160th member of the United Nations earlier this year. For those hams who like to work "real" [U.N.]

countries there is such an award (it comes in various levels, I have the
#1 U.S. award for 120 U.N. countries, which says more about the obscurity
of operating awards than it does about my DXing abilities :-))

So, do any of the OTs remember how many countries there were when DXCC was
first started (obviously more than 100!), when did the total reach 300, etc?
(No flames about how silly country chasing is, that's not the issue!)

OK, I hope you read the summary line above. Here goes:

I've used networks, online services, and BBS's for years, but I've never really paid much attention to packet radio. This may change... depending on what kind of feedback I receive.

Basically, I'm starting from scratch, and need to have some idea of where to begin. I have a list of rudimentary questions like:

1) Just what *is* packet radio?
2) What kind of equipment due I need, and how do I use it with my PC?
3) How much technical (hardware) proficiency is requied to manage a packet radio system? (I have a general understanding of computer hardware, but am more comfortable programming.)
4) Just what's out there for me to access via packet radio? (This is VERY important. I'm not interested in this as a pure hobby, I'm more interested in the resource potentials.)
5) How much will a packet radio set-up cost me? How COST EFFECTIVE is packet radio?
6) What legal issues do I need to consider regarding packet radio? Do I need a license?

etc.

Pointers to reading materials such as books and magazines that my campus or local libraries might carry would be nice.

Personal comments and insights into the world of packet radio would also be appreciated. I've tried reading the ham-radio newsgroups, but a *lot* of it is Greek to me.

Any packet radio operators from central New York out there??

Thanks in advance,

-Tim

WARNING: Following is a Grade A incendary posting. If your Nomex is
out of date, hit "n" now.

lyndon@cs.athabascau.ca (Lyndon Nerenberg) writes:

[massive blather deleted]

>We are not talking about Brians opinion, we're talking facts. It is
>unfortunate that your narrow view of the world only encompasses
>Usenet. If you investigated the history of rec.ham-radio, you might
>be surprised at the number of people who receive this newsgroup
>via email. You might also be surprised to learn that the mailing list
>was around long before the newsgroup was. And yes, some people DO pay
>real money to read this traffic. (I have to wonder why sometimes.)

Interesting, Lyndon, that you'd be speaking so learnedly about the
net, resource management, costs, and responsibility, considering
that you are posting from a freeloader account at a university.
Perhaps when you grow up, get a real job and pay some of the bills
yourself, you'll perhaps qualify to express an opionion that matters.

In case you are wondering, rsiatl.uucp is owned my myself and one
other person. We bought the equipment. We pay for the phones and
electricity. WE pay the long distance bills. And you know what?
I don't mind at all transporting data through my system that I have
no use for. It pleases me to know that I've served someone else's needs.
I guess you don't learn that concept until you attend the School
of Life for awhile.

>How do you suggest that those "driven to poverty" "fix the problem?"

Take some remedial classes and learn to read. Then reread my posting.
You'll get it eventually.

>Alright John, why don't you prove your point. Since it's trivial,
>write the piece of code that will screen out source and binary postings,
>and mail it to Brian. Please ensure that your program catches C, Fortran,
>Pascal, Assembler (680x0, 80x86, 65xx, 68xx, Z80, 808x, VAX, Sparc, IBM 370),
>and BASIC, in addition to uuencoded stuff. Oh yes, don't forget btoa.
>We'll test it by letting you post your code to rec.ham-radio after Brian
>installs the filter.

That's very easy, Lyndon. I won't fix the problem because I don't have
one. If I DID have a problem with net content, I WOULD fix the problem.

>>Most hams use PCs and for the non-PC software, a
>>simple keyword in the title line will differentiate it from the PC stuff.

>Do you have any hard data to back that statement up?

Idiot.

>> This group would be an ideal place for Phil's latest TCP/IP stuff as
>>well as all the other ham oriented software. Perhaps Bdale could even be
>>pursuaded to set up an automatic poster daemon for the IP stuff.

>Have you met my friend John? What a guy! Always willing to appoint someone
>else to a job that will me his life easier! Tell me, John, do you know how
>many bytes of traffic would be involved if we were to transmit every update
>of NET and NOS (not to mention PE1CHL and the variants)? Get back to us
>when you do.

Why don't you tell us. And then point out to us how much incremental
load that would be. I handle upwards of 40 mb/day through this system.
I suspect an addition meg every little while would not even be a blip
on my load map. I should not be too awfully hard on you for not
knowing this answer. After all, it's not your system.

>It sounds to me like John's ftp command is broken.

Works quite well, thank you. That is, when I have time to muck with
it. I don't have the liberty to sit around at others' expense babying
an interactive ftp session. It's much nicer to find the stuff already
on the machine compliments of that mystical, magical system called
usenet. And if I don't want it, expire and rm work rather well on
my machine too.

>   ">- let the people who have a problem with software in
>   >this group fix the problem for themselves."

>>I say
>>this, of course, because he stated a couple of years ago that it would
>>take too much of his time for him to do so when I asked him to set up an
>>automatic E-mail posting to me so I could redistribute to non- Internet
>>sites.

>So why didn;t YOU set it up?

To take your position for a moment, why should I? Not my problem, man.
I have Internet access. It's the people downstream of me who DON'T
have internet access who would benefit from such a service. To take
my position again, I'd be glad to set it up. Lots of work to set up
a cron job. Oh, I forgot, they probably don't let you use complex
utilities like cron. RTFM. Oh, one other thing, I'm sure that
if Bdale has a problem, he can speak for himself.   I'm sure he
does not need a flatulant mouthpiece such as yourself doing it for him.

>Here's my suggestion:
>   John, shut the fuck up!

Such elegance, such grace, such mastery of the English language. I'm
impressed. Tell us more, Nerd-berg.

> >
> > Agreed as to the first part. However, it is simply not true that AM is a world standard. It is a US standard. There are plenty of places in the world where FM is the standard for VHF aeronautical communications.
> > --
>
> If this is so, perhaps someone can list these countries. I assume they must be listed in Jeppesons (sp?). Also, does this mean that to fly internationally I need an extra radio in the cockpit? Or do they now make AM/FM air VHF radios? How do air traffic control tell you that when you next QSY that you will have to use FM?

I have been faithfully e-mailing the following to people who inquired about just where I got my information. Since it has generated more than a little interest/dispute, I will post the story here for everyone to read. If this is in error, I would appreciate someone setting the record straight:

I am the poster of the original note. Last year, I took a trip to New Zealand, and had the opportunity to take a small plane from Queenstown to Milford Sound. I spent some time chatting with the pilot and ATC people. (It was very informal at Milford Sound -- they get about a half-dozen planes a day there, and let me up in the tower.) Since I am a ham, I inquired about their radio gear. They use VHF FM and a lot of HF SSB over there. (New Zealand is mountainous in places, making VHF almost unuseable.)
I was led to believe it is a standard not only for New Zealand, but for the Australian arena as well. When I mentioned we still used AM for ATC back in the States, they were dumbfounded -- holding the opinion it was an outmoded and inferior standard. They said New Zealand had converted to FM years ago.

For what it is worth, I suspect if we could reinvent the wheel at this point we would invent it with FM. However, I think that, given the constraints under which aircraft operate, that AM is not a problem.
I would agree that it would hardly make sense to convert at this point, and if it ever comes about, it would have to be with dual frequencies and a phase in period, to the detriment of everyone's pocketbooks.

My two cents worth...

Quarter Century Wireless Association recommendations in the matter of FCC Docket PR 90-55:

"The Quarter Century Wireless Association, in consideration of the urgent need to bring many new persons into the scientific and engineering fields, because of the projected explosive, worldwide development in electronic communications and, in consideration of the significant role the Amateur Radio Service has traditionally provided as an entry to both technical and operational areas of electronics, physics, chemistry, engineering, and entrepreneurship, respectfully proposes modification of Part 97 of the Rules of the Federal Communications Commission to authorize an entry-class, no-code, Amateur Radio Service License. It is proposed that optional classes of entry-grade Amateur Radio Service licenses be adopted as follows:

Option 1. The Technician Class license would be retained with all present requirements and privileges retained except:

- a: The Morse code requirement would be eliminated.
- b: No privileges would be authorized below 30 MHz.
- c. Special Group D call-signs would be assigned to all qualifying for the Technician class license issued without a Morse code requirement.

Option 2. The Novice class license would be retained with all present requirements and privileges retained except:

- a. The name Novice class would be changed to Communicator class.

The first thing that comes to mind is that ssb with pilot (companded or not)
would be handy for use on sattelites as it could automatically compensate for
changing doppler shift.

Phil Blais asks about hidden antennas. Well, when I was a novice I ran
35 watts CW on 80, 40, 15 and 10 from an apartment using an antenna tuner
and a very thin piece of enamelled wire running across the room, out a window
and up a tree. Invisible, but not the best antenna I'd ever used. Worked,

though. What I'd suggest, however, are the following:

1. Run twin-lead up to aTV antenna mounted on your roof (if *that's* allowed) and from the end, stretch a thin dipole made of black wire to handy trees. Length is not important; make it long as you can and feed it with a tuner.

2. Same trick in your attic. Run the dipole along the ridge and droop the ends to get more length.

3. For the higher HF bands, the AES antenna in your attic might be good.

4. Make attic dipoles from mobile whip antennas- the helical wound fiberglas whip type. Problem is narrow bandwidth on 80 and 40.

5. Run a loop aound your attic; feed with twin lead.

A friend of mine, confined to an apartment, had a very thin and nearly invisable 10 meter full-wave loop stapled to his outdoor porch, and fed with a tuner. He made a lot of DX on SSB and AMTOR, on 10, 15, 20 and 40.

If you have trees you have no problems.

1/4 wave at 80 meters is only about 60 feet or so. Build a vertical with wire and keep the wires close to the tree trunk and they will not be "visable".

QST had an article not too long ago about using a random wire tuner and a spike into a tree that would effectively use the tree itself as the antenna. The nice part about this type of vertical is that it already comes with its own radials :-).

Do you have a fence around your yard? Possibly you could set up a loop antenna around the top of the fence.

If you have a dog put up a zep and tell everyone it is a puppy run. (be sure to insulate the lead going to the dog ;-).

Are there lamp posts near your house? load one up, it may work. The lamp may turn on and off as you transmit so be sure to hide your antenna lead to keep the neighbors guessing.

when working with the above just remember that even though you may get a 1:1 SWR the antenna may not work resonate at all. (i.e. a dummy load has an swr of 1:1)

The only way to test for resonance is to hook it up and listen/transmit or use a noise bridge to determine the resonant frequency of your antenna and then trim it or change the feed point untill it works.

good luck

My how lucky to find an IC-735 on your step. Boy I would love to find one like that. At any rate, you are in luck as the Icom AH-2 tuner is one of the best there is and it was designed specifically for the IC-735. Since you found the 735 on your doorstep, then your ham fund should be pretty flush and the tuner should be no problem :-) :-).

The AH-2 tuner will tune anything to any frequency. Run a short coax jumper from the tuner box out the window and hook it up to the rain gutter (assuming of course you have metal rain gutters) and tune away.

I have used rain gutters many times with excellent results, especially in extremely low profile operations. Granted, it was with the old Collins tuner and a KWM-2A, which is a little more forgiving, but I still maintained good communications over a variety of distances. If you lack metal raingutters, perhaps a wire loop around the building, or a good long wire run wherever it is out of site will do.

Good luck es 73,
Michael

International call signs and general regulations governing various radio services (Fixed, Broadcast, Marine Mobile, Land Mobile, Satellite, Aeronautical Mobile, etc.) are established by treaty through negotiations conducted by State Department representatives. Ham radio, represented by the ARRL domestically and the International Amateur Radio Union (IARU) - an international lobby of ARRL-like organizations, is but one lobbyist at the WARC treaty meetings which come under the auspices of the United Nations.

At present, ARRL is preparing its views and is represented on the State Department committee formulating proposals for the upcoming WARC meeting. Ham radio is but one of many special interest groups lobbying. IARU is preparing worldwide proposals based upon input from ham radio organizations worldwide, etc.

The State Department representatives are diplomats and negotiators - not knowledgable technocrats in the radio communications field. Issues may arise at the negotiation sessions (whence ARRL, IARU, etc. are NOT present) that go beyond the scope of prepared materials. In such cases, our State representatives have agreed to changes without knowledge of the ramifications. For example, at the last WARC, a proposal was made to give a band of frequencies just above 4 MHz to Marine Mobile services. Having no prepared material (this was an impromptu proposal), State agreed - only to discover later that these frequencies are heavily used by the U. S. Military (including all MARS services). Although efforts are underway to renegotiate this point, the fact remains that it is law and if unchanged, the U.S. Government will have to relocate its military communications in this band to other frequencies.

It is more than coincidental that aircraft registration number prefixes coincide with radio callsign prefix designators - the aircraft numer is the radio callsign (except in the case of part 121 - scheduled commercial airline - flights where the flight number is used). Ships similarly carry callsigns, like land stations, that coincide with the radio prefix of their nation of registry. However, ships names long preceeded callsigns, so the registration number or name of a ship usually has nothing to do with the ships official radio identity. Informally, the ships name is used in radio calls but as with other stations, the licensed radio callsign is supposed to be given at appropriate intervals.

By international treaty, every radio station should have a callsign. Whether they broadcast it or not is a different matter. For example, few if any radar stations transmit their internationally recognized callsign - but they are all supposed to be licensed -- except, of course, those belonging to the military of various nations etc., etc., etc.

```

Recently, I've been considering the purchase of a used SB-220.

I've been impressed with the fact that it uses two 3-500Z's and
it seems to be very reasonably priced compared to others in the
same design category (like the TL922).

Any comments or expericnces about this amplifier would be
appreciated.

Thanks,
de Fred, AA7BQ

I am glad we settled that it *is* in a ham band. Otherwise ARRL
would get a pink slip, as they use that frequency for announcements and
code practice.

That in itself would keep anyone in the northeast from buying a 3.58

(or 3.5795..) crystal for contacts.

I had an Argonaut a few years ago with this same complaint. As I recall I found two problems. An electrolytic capacitor in the microphone amplifier had "dried out" or lost value messing up the frequency response of the amplifier. And the radio was out of alignment. The filter was not centered properly, referenced to the carrier oscillator. This is the first radio I have ever found to be out of alignment without a component failure. Anyway it had fine transmit audio after these two fixes.

I also had a receive problem with this radio, the audio would drop to a low level and become distorted. A sharp rap on the case would bring it back for a while. It turned out to be an oxidized connector to the mixer board. If your Argonaut is an older unit, do open it up and clean all the connectors. This is good advice with any "modular construction" equipment since manufacturers tend to cut corners here and not use gold flashed contacts. The solder coated connectors used in most equipment reacts badly to

the sulfur dioxide generated by the catalytic converters on newer cars.
That "rotten egg" smell you often notice from newer cars is the precursor
of sulfuric acid which will react with the lead in the solder and turn
it a black lead sulphate rather quickly in urban areas.

This rig has fine audio when it's working right. The input impedance
for the microphone circuit is 600 ohms while your D-104 uses a ceramic
cartridge with an output impedance of 50,000 ohms. If you intend to
use the D-104, you'll need an impedance matching circuit and probably
a preamp. I use a D-104 on an old B&W 6100 transmitter and have always
liked it's "communications" frequency response characteristic. This is
not a "HIFI" mike by any stretch of the immagination. Most electret
microphones have a very flat frequency response of "broadcast" quality,
that's why we've changed over to them almost completely in the broadcast
business. Impedance matching is critical to good frequency response so
please take all steps necessary to match your microphone to your rig,
you'll be glad you did.

This is so true. The only "all band" antenna that I know of that meets your requirements was made by a company called Lattin Radio Labs in Owensboro Ky. This was a 66 foot long multiband dipole tuned by stubs with loading coils on each end for 80 meters. It was made of tubular twinlead with shorts between the twinlead wires at the stub points. It was a clever design and worked very well handling up to 1 kw on all bands. I used one for several years until a storm finally broke it. I haven't seen any ads for it in QST for some years and I believe that Mr. Lattin has passed away. I thought of duplicating it using 12/2 house wire instead of twinlead but never did since I moved to a QTH with enough room for a big antenna farm.

I have a PK-88, amongst other TNCs. It works as advertised. Seems to run a tad warm for my liking. If I was putting it on a hill that gets warm, I would put a better heatsink on it and punch some ventilation holes in it. I did that with my TNC-1 in Gucci box, it made both of us happier.

And where is lakeside? Knowing Californian geography, it probably isn't near a puddle let alone a lake.

Yours from where there are no woods and no holly grows here, although I once saw a couple of bushes in Studio City. But then Studio City having no cathedral isn't a city. And Cathedral City outside Palm Springs has neither a cathedral or a city, just a bunch of waterbed shops and gas stations. But I digress.

The coating on cheapo connectors is tin, not really solder. Tin contacts work fine if they get excercised and kept away from moisture and such. But if you can avoid them do so. They always get noisy. I prefer silver. Although silver tarnishes (yes sulphur again - never eat boiled eggs with a silver spoon, it annoys the butler), the tarnish is conductive. Tin oxides and sulphides are not conductive and gold stays shiny no matter what and it will never make your fiancees finger green.

> That "rotten egg" smell you often notice from newer cars is the precursor

> of sulfuric acid which will react with the lead in the solder and turn

The the rotten egg gas is hydrogen sulphide which is now considered toxic and when I was a schoolboy was considered to be great stuff that also gave adults headaches. Most tarnishing in urban areas is caused by sulphur dioxide. This is a by product of coal and oil combustion. It is also found in wine so try not to spill the Ripple into the electronics.

For those of us lumbered with budget tin and even zinc connectors, I suggest some prophelatic treatment with Cramolin Blue and Red. The blue cleans off the crud and the red protects. But you can also clean off with denatured alchohol and coat with Electrolube.

]instead focus on the fact that we'd scrubbed. From Jim Grubs' comments here,
]as well as others I've heard just about everywhere I listen, they're completely
]right.
]
]_I_ am getting tired of the double standard here: first NASA is shot at for
]trying to launch too quickly, and cutting corners on safety in the aftermath
]of the Challenger accident, and then they're shot at for taking precautions
]for safety reasons and delaying flights. You can't have it both ways!

Jay, the real problem is that NASA sold the shuttle system to congress and the public as a reliable, cheap launching system. Pressure to meet that promise caused the Challenger accident. They still can't admit that the shuttle program has been an unmitigated disaster.

It has greatly reduced america's space launch capability. It has led to such potential disasters as a several year window when we could not launch any KH series spy satellites, when only one KH-11 was functional. We currently have only one working geosynchronous meteorological satellite, when we are supposed to have two active and one in-orbit space. Now we find that the replacement (which was supposed to be launched years ago) has defective mirrors and would not work. Then there's the Hubble telescope.

Yes - NASA has a lot to answer for. As with any government bureaucracy, NASA has become barnacle encrusted, and has replaced engineering decisions with political decisions.

On the other hand, I have great respect for the technical people in NASA. Many of these people are incredibly well educated, very bright and yet accepting relatively low government pay because of their devotion to the space program.

From article <44784@apple.Apple.COM>, by chuq@Apple.COM (The Wandering Phew):
>>>My guess is that (1) converting to FM would be super expensive for airlines

> Actually, it's simpler than that. Safety. If you have two AM radios on
> the same frequency, they'll garble each other. FM is more likely to

Are you sure this is the reason? Why then don't all critical transmissions take place on AM? I scan local police regularly. When they have broadcasting collisions they are always quite noticeable and they're using FM...

Hi,
I mentioned in my comparison of the R1 and AR1000 that there were a couple os short cuts for programming it. One thing to note, my unit came with newer documentation than my friend's, and covered some things not in his doc. I can't remember the differences, but below are some hints not covered in any of the docs.

To program in a frequency to a scan channel, get to the channel of choice, type in the frequency, hit enter, then select
AM or FM. Hit the AM/FM or WFM even if you didnUt need too
For some reason, the frequency is now programmed in. Then to go up in sequential order I just hit the manual button which advances up to the next channel. Note that if you don't
hit the FM/AM or WFM key you can listen to that channel with-out adding it to the scan memory. You can also manually search up or down from there. The

problem is if your not in the right recieve mode (AM/FM/WFM) and you change modes then that freq. is stored. I always leave channel 000 as a scratchpad location to do manual searching and direct frequency entering... I find this a plus feature.

There is no way (that I know of) to simply review the limits set on search banks. One hack is to enter the search, which always starts at the beginning and then search down (manually), this wraps around to the upper limit.

Remember to make use of the freq. lockouts in the search mode. For example I use only one search bank to search a range of freqs. that has some annoying signaling channels in the middle of the range. The other, less optimum solution, is to use two search banks and link them together.

Glen

The SB220 is a nice amplifier. Mine still works great, and I built it from a kit over ten years ago. It is rugged, and I even use it on RTTY with 500 watts out.

You might check out the mod that involves replacing the diode string in the power supply with higher rated diodes, and equalizing resistor/cap in parallel with each one. I also operate mine without the green cover (there is still internal shielding) and I have several surplus muffin fans sitting on top to provide additional cooling for RTTY operations.

It is a nice rugged amp, although there are other amps like the Henry 2K that use 3500Zs and have a beefier power supply. I sure would prefer it to Heath's new version that has just one tube.

True, but this assumes that there will still be a government still in control of the situation. After a massive nuclear attack, there may not be a government left worth mentioning. A state of chaos would exist on both sides of the conflict; neither side would be able to mount a followup assault. Thus, the war would be effectively over.

How about a ground mounted vertical for 10,15 and 20 mounted
inside a piece of white PVC pipe... tie-wrap (don't use wire)
an American flag on it and be the most patriotic person on the block!
If I'm not mistaken, I have seen some of those kind of verticals
that are about 15 feet long and are slim enough to do this.
You can bury the radials at night when no-one's looking...
Not only will noone know you have the antenna but you won't be
blamed for TVI every time someone gets a glitch on their TV
even when you are not operating!

If what you mean by this statement is that you are embarrassed by the
constant scrubs, then I would have to disagree. I would prefer to delay the
launch than to see the thing blow up. It is much better to err on the
side of caution.

Speaking of mysterious carrier signals, how about the one at 28.626?
It is the 8th harmonic of the TV colorburst frequency. Those TV sets
that surround us are quite strong even at the 8th harmonic.

> I would like to get a license to use a ham radio. What do I have to do?

Study and take the test at the next local hamfest or periodic exam date, usually sponsored by a local repeater club.

> Do I have to know Morse code or has that changed?

Yeah, unfortunately, 5WPM. Pick up a copy of "Tune in the World with Ham Radio" (did I get the title right this time? :-) and the tapes that go with it, from a local radio/electronics store, or order through a bookstore. It will give you what you need. Good luck, have fun.

Hello. I have been a ham since the fall of '88 and received my Technician ticket last October. I've gained some interesting info and have refrained from jumping in the fray on the numerous long-winded debates on this list. However, there are some opinions I would like to voice.

It's extremely unfortunate to read the large number of messages from hams who apparently have not only decided what the hobby means to them but have decided that it should mean the same thing to all others. For example, you're only a "real" ham if you punch a hole in your roof to mount your antenna and build/repair/modify your equipment.

This sounds extremely elitist. Hey, I know these folks don't know me and it's probably not personal. However, it is insensitive and it doesn't do anything for the hobby...especially on a list like this which is subscribed to by many different people.

What I got into ham radio for was the communication and the friendly atmosphere -- not something you can (or are meant to) find on any other communications service. I wasn't interested in the technical aspect at the time other than to operate my equipment safely and competently.
And if I had been given an attitude by hams around me that I could only be a part of amateur radio by being a "techie" I probably wouldn't have bothered. That's why I got into it. Others probably have different reasons. I don't expect anyone else to espouse mine.

That's the nice thing about hobbies: you can get what you want out of it and participate to whatever degree jazzes you.

Thanks for your attention.

Bernie, N5PQY

>dipole that could fit the bill?

I really enjoyed my 40 meter dipole.  Check your "Tune in the World...",
for the formula, but it was about 66 feet.  It had the advantage of being
nearly resonant on 15 meters as well, and when 15 meters is open the DX
can be a real blast.

Actually, I averaged the length of a 40 meter dipole and 3 times a 15
meter dipole.  Had reasonable SWR on both bands.

By the way, I have since ruined it.  I thought that having 80 meters
would be nice, so I bought a pair of traps so I could make it a 40/80
meter dipole.  Since the 40 meter traps act like an open circuit at
resonance, both 40 and 80 work fine.  But the 15 meter capability is
lost.  :-(

The GEnie Radio Round Table is well worth the cost of GEnie's Star Service monthly charge of $4.95. The Radio BBS is one of many conferences that will be available at no hourly charge - all you want for your $4.95. Keep in mind that the Radio BBS is but one of several features available in the Radio Round Table. There are a couple of dozen active discussions at this time, including the Middle East, Scanner Mods, a Newcomer's Corner and plenty more. There's a file library of radio-related files that has several hundred items available for download, as well.

The Sysop is Larry Ledlow, NA5E, formerly of 73 Magazine. He does a great job and the forum is well moderated, lively and informative. Some months ago, Havana Moon and I introduced the GEnie bunch to live DXing - something which is consistently found to be addictive and plenty of fun. GEnie now has monthly live DXing sessions and it has proved to be such a winner that Larry is planning to do a live session once a week.

By the way - I have no professional affiliation with GEnie - my comments are simply those of a happy customer.

I would recommend moving, for reasons other than the radio. If it is
buzzing that loud, something is definitely wrong. If you are a lot more
daring, you might get some incendiary devices............[never mind]

> The question: Can anybody give me some idea of what to expect in
> the way of a QRN spectrum from those #*$@(&$# HT lines? I mean
> aside from the cancer, that is...

It may be varying with the weather, too. I can hear radio noise as high as UHF coming from the primary lines going by my apartment. 160 meters is useless most of the time, and 80 meters is much of the time.

> I own the house so I can put up pretty much any kind of antenna - no

I guess moving won't be as easy. And of course none of the hams would buy the place.

>No, the 80 meter Novice band is currently 3675 to 3725 KHz.

I believe this is a proposal by the FCC that has not been enacted upon yet. It was to relieve the novices of QRM from Canadian phone operation.

ARRL has counter-proposed to simply expand the band (now 3700-3750) to 3675-3750.

Re: RF getting on the coax cables when shunt-feeding a tower.

My suggestion would be to:

#1. Connect the coax shields to the tower leg at the bottom. And:
#2. Make sure the bottom of the tower is at RF ground potential.
The easiest way to do this is to connect a couple (or more)
quarter-wave radials to the bottom of the tower. I realize so few
radials may not be suffcient to reduce ground losses, but at least
it should decouple the tower base and reduce your "RF in the shack."

charyd@silver.ucs.indiana.edu (david chary) says:

(this bit from Jim Price K6ZH)

```
>There is some logic to some of the basic pattern:
>
>    D (part)        Deutschland
>    E (part)        Espana

>And then there are basic letter allocations that don't track:

>    P               Holland and possessions
```

Actually, P does make some sense. In French, the official language
of the ITU, Holland is referred to as "Pays-Bas".

Very clever.... but then shouldn't the Germans have got the A series
instead of the D series?

I agree with the original poster (sorry, forget who it was now) who
mentioned whiling away time at international airports checking out
the 'calls' on airplanes. It can make you seem quite erudite to spot
a tiny piece of fuselage with "SV..." on it and casually say "hmm,
probably Olympic Airways", who says ham radio is useless? :-)

Just skin back the outer insulation on your coax at the base of the
tower and bond it to the tower with a stainless steel hose clamp.
Pot the whole joint with roof cement to waterproof the connection
and no more RF on the cables. This also helps protect your shack
from lightning. An even better solution would be to use a commercial
lightning supressor at the tower base since that has an arc cartridge
to protect the inner conductor as well. Rotor cables can be bypassed
with .001 caps from each lead to the tower base ground. Again, commercial
lightning supressors are available for these cables as well. I've
shunt fed my tower, 60 feet with tribander on top, for 80 and 160
meters and it works well.

I don't know if there's a formal agreement between the ITU and the
International Civil Aviation Organization, which assigns aircraft
prefixes. I suspect it's more along the lines of "if you don't have a
preference, we'll use the same one." There are some differences between
the two lists, most notably in the Communist world.

Well, I've worked as an avionics technician for about 4 years, including work on corporate jets that often fly internationally to Europe, Asia, Russia and South America. The standard for voice communication is VHF (118-150 Mhz) AM communications.. The only place FM is used on aircraft communications is on long range HF for ocean crossing and Flitephone. I'm not even sure the HF radios are FM...

While FM is a fine idea, at the present with "cheap" radios costing $3000 for general aviation planes, the cost of retrofitting to change would be way more than most owners would pay. BY the time the radios were installed and signed off, it would cost $6000-8000 per plane and the "old radios" would be worthless so there would be not trade-in to help defray the costs. Despite the view that all plane owners are "fat cats" most are just average joes, and many general aviation planes are worth less than $25,000 so this would be a very heavy burden. Of course we could demand retrofit of anticollision airbags to all cars!

```

I am working on a project at the University of Oklahoma. I need input and this seems to be an efficient method to hear from people who know a little more about electronics than I do (I'm an ME). We are developing a portable, 100W remote power system that couples wind power and photovoltaics. If you can spare a few moments, please answer the following questions...

1. What can a 100W system be used for? (camping, military, etc.)
2. Would you recommend 12V or 24V system? Why?
3. What would you consider to be maximum allowable weight? Why?
4. Do you think there is a market for such a device?

Even if you aren't going to answer, thanks in advance for reading this far.

I have an HP 8558B Spectrum Analyzer that has a blown first mixer diode.
Does anybody know which diodes would be suitable replacement. HP gets
big $$ for a replacement pair.

I believe the diodes are germanium because of their low (.34V) forward
junction voltage. They also have to be microwave, since the mixer
operates around 2GHz.

Mike its a hard to say how bad the line noise will be at your QTH but thought I would pass along the experiences of a friend of mine.

My friend had high-tension lines directly behind his house. So close, in fact, that once when putting up a 65' vertical it came in contact with the lines (he was OK after several days in the hospital, but thats another story).
He later put up a 70' tower with several yagis. He did have a fairly bad line noise but was able to make contacts easily. He entered a number of contests and was able to finish the the top 10 on several occasions.
His line noise varied greatly from day to day, sometimes almost none, sometimes so much that most weaker signals were not readable. All in all, with a good antenna he was able to have a good time on the HF ham bands.

If you are planning to buy the radio, to run at least mobile anyway, it would be easy to put up a small inexpensive antenna (dipole) and see how bad the noise is before investing in a larger antenna.

Hope this helps,

I have owned an ICOM IC-2AT and currently an ICOM IC-32AT. I have always carried them on board in plain view without any trouble. I have had them x-rayed with no apparent problems, but normally, I simply hand it over for a visual inspection. Since the bombing in Scotland, many times they will ask that I power it up and unsquelch it to demonstrate that it is real.

Apparently, now with the proliferation of portable cell phones, the airlines are concerned with persons attempting to "make phone calls" during flights. I had one flight attendant ask if it was a cell phone. I assured her that it wasn't and that I had no intention of operating it during flight. That seemed to calm her down.

Open your head a little bit, Ken. Some people read what you apparently see
as rec.ham-radio as mail from info-hams, a digest (a number of
messages sent as a single mail message to save network resources) and
don't have undigestification software available.
There's more to the world than you know, apparently.

I have had to turn it on & crack the squelch before, but sometimes it has actually made it easier to go into some concourses that I would probably not been allowed in. When meeting someone at the airport, I usually just unclip it from my belt & toss it directly on the X-ray belt. No problems so far.

Julian Macassey gave a very nice explanation of the reasons for the decline in kit popularity.

Bill Gunshannon then asks:

>I am not saying HEATH should have been cheaper cause it was a kit.
>
>I am asking why it costs MORE than a comparable piece of equipment
>designed and built buy the same off-shore companies.

I suspect that the extra cost is due to 1) the time it takes to package and check all of those little bags of parts and 2) the time and effort that goes into writing an assembly manual that anyone can understand.

>Pull string taut and presto! Wireless, no-power voice transmission!

Well, it may be wireless, but it isn't "no-power"; I've used examples of this system, and it's been my experience that the transmitters at either end must be periodically fueled to keep it running. A cheeseburger was the fuel of choice, with a chocolate shake or a Coke for lubrication.

(There also seemed to be a need to periodically take the transmitters off-line, apparently to drain used lubricants. The transmissions would become increasingly garbled and unreliable if this were not done.)

Oh, yeah: :-) :-) :-)

Hello,

Since our university library being kind of hopeless, I am wondering wether someone in the net-land can answer this question for me.
Are there any kind of restriction on non-immigrants (I am here in the States on a student visa) applying for a ham radio license?

Thanks a lot.

According to the FCC Rule Book, anybody can apply for a U.S. radio amateur license, citizen or not. The only exception is for "representatives of a foreign government". As long as you aren't attached to an embassy or a consular staff you should be OK.

Consider a dipole center fed with open wire or twinlead. Then use an antenna tuner with a BALANCED output to tune it. You could make the wire 1/2 wave on 40 meters (about 65 and a half feet), or you could make it non-resonant and just extend it to the full 70 feet, and possibly it will tune to 80 mtrs as well.   If it doesn't tune to 80, you can take the feeders and short them together, fed from the unbalanced tuner output. This will operate as a Tee, or a vertical wire with top loading.

If you use balanced feeders (like the popular 450 ohm ladder line) you should be able to tune it on all of the Novice bands. This is the classic multiband Zepp antenna, and you wont need any fancy traps or multiple wires. On 10 meters it will be somewhat directional.

I am a new Ham and am getting my feet wet in the VHF and UHF sandbox. I have converted a TV rabbit ear to a 2m dipole which seems to work fairly well. (Anything is better than the ducky which comes on the IC-24AT.) So now I want to build a 70cm dipole and thought the same approach would work. But I have some questions which were not answered by the HANDBOOK.

1) I have been told that the overall length of the antenna should be the half-wave length, yes?
2) At what point does the o.d. of the antenna elements become significant WRT frequency?
2) What is the relationship of the distance between the feedpoints to anything.
4) I read somewhere that the 70cm antenna has a much smaller signal collection area, so a dipole isn't a good idea. That a multi-element beam is better simply from the standpoint of "collection area".

Thanks for any help you you can offer.

>ill effects. As a matter of fact, what problems do you forsee encountering if

>they are x-rayed?

X-rays can cause crystal defects in IC's. All things being equal, the
denser the circuit, the more prone they are to damage. As far as I
know, the effects are cumulative, so the upteenth exposure is more
likely to cause failure than the first. Arguments from the attendent
that the dose is near zero don't wash as long as they have the warning
sign to keep your hands out of the machine

For me, calculators*, electronically controlled cameras, etc are strictly
hand search or lead bag.

*The calculator part is left over from college days when my calculator
represented a huge investment. Now it wouldn't hurt me so much if one
died.. the risk is there, but the loss is less.

If they've got brain-dead software, that's their problem.  The last
thing we need is enforced compliance with the lowest common denominator.

Undigestification (now *that's* a word) is just not that hard.

> (not at the "zero beat" frequency).

You can compandor the signal in any modulation mode. They chose to do it with SSB to help overcome the problems if interference. By having the variations in level be logarithmic instead of linear, the linear form of interference will be reduced upon uncompandoring.

Compandoring needs some sort of reference signal to set the levels to match the received strength. The pilot tone can do this better than the carrier since it can be set further from the audio, making separation easier and allow for poorer frequency tolerance. Now that you have a pilot tone, it can also server as the "clarifier" reference, and so the carrier is no longer needed. "ACSB" is the tradename owned by Aerotron, Inc., for their version of ACSSB that includes the pilot tone around 3.7 kHz. This is the narrowband mode they proposed to the FCC.

ACSSB and ACSB are NOT an R3E or H3E mode, but are really forms of J3E since the carrier is totally absent.

> According to one of our local experts, it works well for point to
> point. With mobile, you can get signal phase reversals from the
> constantly changing multipath and your audio just goes "splat" (his
> term) whereas with FM you would just get a click.

It can drive the compandoring nuts, I guess, since there would be some delay. Also the "auto clarifier" or "frequency lock" could get upset, especially at phase crossover.

I would like to encourage amateur experimentation with R3E and H3E.
There might be places it is useful. If there are any, shouldn't WE
be the ones to find it?

I would also like to see SW broadcasters make use of H3E on 5 kHz spacing. They could get a lot more stations in the bands they have with less mutual interference. If they settle on a particular sideband (such as upper) then a lot of the interference problems can be eliminated, such as overlapping sidebands from some of the exist 5 kHz spacings.

The title pretty much says it.. What is on 144.383, whatever it is it's pretty strong in the SF bay area. I hear it on two very different rigs in locations 40 miles apart. Sounds like some kind of telemetry.
Anyone know?

Electrets are indeed very high impedance and are coupled with a FET used
primarily as a impedance transformer (source follower). Some electret
microphones then follow the FET with a preamp, some don't. I know that
the Icom and Yaesu headsets DO use a preamp following the FET. The preamp
is located in the push to talk box while the FET is physically mounted
with the electret element. There is a gain control on the preamp accessable
through a small hole in the switchbox. Running the preamp at reduced
voltage will indeed cause lots of distortion.

I owned one of the DR-110T's, and my only complaint was getting some intermod
on several of the 2-meter frequencies when I was in high RF areas. However,
this is a common occurrance with the broadbanded front ends that most of
these modifiable receivers have.

I currently have their dual bander DR-510T. It is a great radio! The DR-510
like the 2-meter model can cover the 350-370 and 850-890 (I think that's right)
band, so if you have trunked 800 mhz services in your area, you're able
to receive these stations.

I can honestly give my DR-510T an A+ for operation, and I'll be buying
more Alinco products as their customer service appears to be very
oriented towards helping people.

> I'd like to hear from anyone who has some experience with the working of the `electret' type microphone.

I've designed them into telephone circuits, and used them with radios. They are not my favourites for communications for several reasons: They are very sensitive to RF. They are Hi-Fi - cover lows and highs - not good for comms, especially in a noisy environment. They have no "threshold", unlike carbon mics, they will pick up noise a room away.

They have the following in their favour: They are cheap - $00.30 in quantity, carbons and dynamics cost about a dollar or more. They are small and light.

>
> The Paragon (since Tentec sells electret microphones) has a low-level (about +8.4 VDC through 680 ohms) voltage available on one of the pins in the microphone connector.

As I recall, depending on the model, Electrets want between 1.2 and 4.5 Volts MAX. They are polarity sensitive and just a sniff of voltage is all you need. Plantronics headsets, which use an electret, as I recall work fine with 3V though anything from 1.5 to 15 seems OK.

> Rather more recently (the last few months I think) I saw something on electret type microphones, and I believe (can't quite remember enough of the article to be sure) that the inferance was that current electret microphone elements incorporate a pre-amp within the housing of the microphone.

Yes, they all do as I recall. Also as I recall Panasonic seems to make most of them. There are 2 wire and 3 wire versions. The 3 wire are nifty cos you can use a seperate battery to power the mic and run the mic leads straight with no DC blocking etc. Rat Shack used to carry these mics somewhat over priced. You can salvage them from dead cassette recorders and answering machines, let alone dead $10.00 junk phones.

>

> internal amplifier is operating in its linear region.

I would say the voltage is too high and the electret output may be overdriving your mic preamp. Plus, don't forget to RF proof that mic. Bypass at the element with a 1 Nf cap and try ferrites and chokes on the leads.

Isn't playing with audio fun, you can hear how you are doing - instant feedback.

Maybe the University ham club should be able to answer this. They should have the info.

> Are there any kind of restriction on non-immigrants (I
> am here in the States on a student visa) applying for
> a ham radio license?

I suppose next to "Can I take my walkie-talkie on a commercial flight?" this is the next most often asked question. As the resident wetback I can answer:

Simply put, if you are not an agent for a foreign government and can produce a real photo ID (Passport, Drivers Licence, Student

ID etc) you can take the exam. You don't even have to be in the US or have a US address to take the exam. So if there are any volunteer examiners amongst US troops in Saudi Arabia, they could administer exams for the locals so they could get US call signs. They may not be able to get Saudi Call signs and US citizens may not be able to get Saudi licences, but that is life and bureaucracy. It is also why I like the US so much. Civil servants in the US are here to help you not thwart you as they seem to want to do in the rest of the world.

Take the exam, get the licence, have a hobby for the rest of your life.

In reply to Paul, yes, electret capsules of the type sold at Radio Shack and elsewhere have a built-in FET preamp- sort of a solid state cathode follower. I've seen two types: One has two wires, and requires DC to be supplied on the signal lead, with a blocking capacitor between that lead and the output. The other type has three wires, and appears to have a built in blocking cap.

I've used these capsules in many rigs, from my long-gone DX-Handy to various HTs. But let me suggest that the *optimum* microphone for your Ten-Tec is not an electret- though Ten-Tec sells them- but a good ol' Astatic D-104. I've never had such good audio reports as when I use this combination.

Some time ago I promised this group a review of the DIgitrex all-HF QRP rig when it finally arrived. Well, after numerous delays for parts availability, problem fixes and so on, I finally cancelled my order about 10 months after I placed it. They are supposedly shipping now, and a friend still has one on order, so I'll still try to post his comments if and when his arrives.

In the meantime I found a used Ten-Tec Argonaut - an early one, judging from the SN- that I've been having a bit of fun with. 2 watts output on 80-10 SSB is a bit of a challenge. I've been playing with microphones in an attempt to get better audio, but the best I can get is "you sound like you're holding your nose under water". Anyone have experience playing with these? My next step is to wire up one of my D-104s, but this seems a bit large for what is intended to be (for me) a battery-portable rig.

>Is there a small non-dipole or a 70 ft.
>dipole that could fit the bill?

One of the best all-band antennas is the center-fed zepp. It's a dipole fed with open wire feedline, and matched to the rig through an antenna tuner. I use one that is about 120' long, and it works very well on 160 through 10 meters. If you can make it 70' long, it should work well from 80 through 10. There is very little loss in this type of antenna system if you use good feedline. I have found that the commercial 450 ohm stuff is usually adequate. For me it worked fine on 80 through 10, but was quite lossy on 160 due to the extremely high reactive current in the feedline on that band. The commercial 450 ohm feedlines use #18 copperweld conductors, which wasn't adequate for the high currents I get on 160. I made my own feedline out of #12 wire, using 6" lexan dowels for spacers, and improved my signal on 160 about 3 - 4 db, but no perceptable difference on the other bands (I made field strength checks with a local ham before/after).

I have used this type of antenna at many different locations and have always had predictably good results with it.

I have found that the local power company is very responsive to complaints about arcing and power line noise. If you can demonstrate the noise in an AM radio and show them approximately where it is coming from, they always make an effort to find and fix the problem.

I have travelled quite a bit carrying my HT in my briefcase. I have flown on both military and commercial flights. The only request I have had was from MAC Medevac flights to remove the battery pack from the radio. I have had both my Icom IC-2AT and Kenwood TR-2600 X-rayed dozens of times at airports, with no ill effectsathat I can determine. (It has never bothered my film either). I have even sat in the waiting areas and chatted on local repeaters whaile waiting for my plane. I have been through Atlanta, Portland, Memphis, Mobile, New Orleans, Denver, Seattle, Dallas-Ft Worth, Minn-St Paul, Tampa, Orlando, and numerous other airports. I have demonstrated the radios several times, but only as a curiosity factor, never because there was a concern over the equipment. I also have never been told I could not operate the radio on the aircraft, but then again, I didn't ask or try. (Please let's not start up again about using radios on airplanes.)

My travelling has slowed down the past year or so, so there may be some increased paranoia at locations I haven't been to lately. Your mileage may vary. Maybe I have just been lucky over the years and haven't gotten a hard case security type.

At any rate, I would continue to carry my HT in my carry on stuff and use the appropriate discretion in using it.

73,
Michael

I was a little rattled when I flew from Cincy to National/DC and back with
my HT in my briefcase (it got x-rayed, I don't mind):  I put the case on the
belt and said, "I've got a radio in it," and they DIDN'T ask to see it work.
Personally, I'd rather that flights going to our nation's capital be a LITTLE
better inspected...(-: or )-:, I'm not sure!

With companded SSB, the pilot signal isn't a reduced carier, but a tone.
(not at the "zero beat" frequency).

According to one of our local experts, it works well for point to point. With mobile, you can get signal phase reversals from the constantly changing multipath and your audio just goes "splat" (his term) whereas with FM you would just get a click.

X-rays can also erase EPROMs. Which may be used in the uProcessor that figures out what the radio is to do when you press on the various buttons.
If I remember right, nowadays EPROMs are cheaper than permanent ROMs, and I've seen versions of EPROMs without the erase window.

In the seventies, Kastrup Airport (Copenhagen) used to have an FM high band channel that carried tower to taxiway comms. It was a repeater crosslinked to the airband channel. The purpose of this was that ground crew could follow and communicate with the plane to ATC stuff on their Storno walkie-talkies. This is not FM air to ground but an interesting cross link, especially as this was about the only chance to hear English spoken on VHF FM comms stuff.

Still waiting for a list of countries that use FM for air to ground.

John
Sorry to post the reply but a direct reply seems to bounce.
I have an extra 8558-60004 first mixer assembly. I also have an extra mixer board only but it also is missing the mixer (:>).

The diodes are no doubt Schottky and thus the lower junction potential. I suspect that HP makes the diodes themselves. I might be able to dig some up if I had a part number (I'd have to find someone on the line that makes the mixer assembly or else thrash through a lot of documentation). I suspect that a standard diode array from Metellics or other manufacturer would also work fine. Should be under $10.

I read this in rec.humor.funny and I can not stop laughing / crying...

Taken from rec.humor.funny...

The following is an actual letter. The original was typewritten, and all spelling and grammar has been carefully left intact, including errors. I thought this was pretty funny.

To Mr. (name omitted)
District Manager for Alabama
Radio Shack
3300 N. Pace Blvd
Pensacola, FL. 32505

Dear Sire,
This letter is complain about the problems I have having with the ham radio model number 19-1101 I had got from your company Radio Shack. I had this shipped special to me from your store 1096 Eastdale Mall Montgomery Alabama. I was got this because I think that i would get transmitt furthur that I did with the TRC 217 40 channel walkie talkie.

The problem that had first was when I was going to hook this radio HTX-1000 to the antenna the conektor on the radio was wrong it wouldn't attach to my cable. I was able to hook it finally by making a small change in in the connektor. As soon as I tried to use it there was no sound coming at all. This happened for two days and I never did get to talk to anybody the whole two days. That day the cable company came knocking my door and said there was something causing problems at my house and disconnekted my radio from the cable line. you knew when i brought the Radio that I was going to use that for my antenne. You didn't tell me not to why not?

Next time I decided to put the HTX-1000 in my automobile I thought I would see how it worked their. I hooked it to my CB-antenna and at least I could hear people. But what happens now is no one wants to talk to me because they says you have to have a licencs to talk to them. Why? I dont have to have a licencs to talk on my CB. They'll talk to me there. Anyhow it dont matter much anymore because somebody done took the radio HTX-1000 from my automobile.

What I would like for you Radio Shack to do is refund my money because I don't have the radio anymore and its not my fault i dont and I think you should give me back my money. Also the cable company here says that I hurt something in there line and want to be paid fix it. It will cost $27482.98 to fix the equipment they say was damaged because you didnt tell me not to hook it to the cable. Please remit to me the check for $27758.53 for damages due. To save this matter from going to court the check must be in my hand by June first or I will turn this over to my attorneys of law.

Thank you

There are no restrictions whatsoever. Anyone, of any age, can apply for,
and get an amateur radio license in the US.

In laying out circuits, I sometimes cheat and see how the commercial
guys did it on a similar circuit. Part of the problem of homebrewing is
that you don't have the extensive design rules database that the
commercial guys do.

I've never seen toroids laying on a ground plane in frequency-sensitive
circuits.

Re: dipoles

70' is almost ideal for a 1/2-size G5RV. It's mostly resonant, so you
may avoid buying a transmatch. It is resonant on 40, 20, 15, and 10.
As a novice, I don't think you can use 20 and 15 CW, but it gives you
incentive to upgrade to tech. :)

The G5RV can be bought as a kit, but if you can find an Ernie, you can
probably build one for free. If $$$ is a consideration, a transmatch
can be built with the help of an Ernie. The commercial models, like the
MFJ-949C are around $150 for transmatch, SWR meter, and dummy load.

This morning while driving to work I was tuning around the 10 meter band
looking for a QSO. I had heard that 10 meters was doing pretty well over
the last few days so I thought I'd give it a try durning my commuting

time. Well I heard a lot of DX from Europe on the band and heard some
classical music around 28.800. I wondered what jerk out there is playing
music. Then I came across the carrier and realized it was AM. I of course
figured it must be a harmonic and tuned to 9.600 MHz. I was right on
my first guess. It turned out to be Radio Moscow. I was rather surprised
of the S9 signal I was getting of their third harmonic with just a short
Larsen 10 meter whip on the roof of the car. I called up the ARRL and
reported the interferance to Luck Hurder which stated he'll be reporting
it to the FCC. It appears he sends a monthly report of several hundred
cases of interferance each month to the FCC. Of course we can't expect
much to be done but at least it was reported. So I guess if you have
one of those Uniden or Radio Shack 10 meter rigs and commute on the
East coast you'll be able to enjoy Radio Moscow in the morning. I heard
them from 1251 to 1300Z. They signed off at 1300Z and I don't know how early
they were on... Happy listening :-(73 DE KB2GLO, Tom.

I agree!

This makes a mess of the INFO-HAMS digest, too.

> A proposal for rec.radio.software will be met with exactly this objection
> from the admins of the net. For such a group to pass, it will need an answer
> to that objection.

I believe this will very likely be the case. Post things in the appropriate comp.* group and if people there complain that things should be in a ham related group (not likely due to the low numbers) then that is usable as the answer to the admin objections.

Please return this discussion to talk.politics.mideast. It has little
to do with ham radio, regardless of the participants. And it's boring.

RE : Common sense

Come on - give me ONE good reason for posting, not once but
twice, the unreadable reams of SuperMorse source code.

Posting source code is a ridiculous waste of net resources and
is just plain annoying. If you have source code, why not just
post a short message saying that you have it and giving
your e-mail address? Wouldn't that be a better idea?

The novice band is currently 3700-3750. I found myself spending a lot of time in this band when I held my tech license, and made my first-ever HF contact with N8JLK, running 3rd party before I had received my license in the mail.

I would be interested in a history of how the bands have changed over the years; like a time-line showing what bands expanded, moved, were taken away, etc. over the years. Does anybody have such a thing prepared for posting?

I see what you're saying - it sounds like a discussion group, where not only software would be posted, but also discussion about commercial packages, etc. I had to look at what you said three times to understand the meaning.

The problem is that it's not just for binaries.

>Cheating? How else would you do it with ONE WIRE? RF? Nawwwww...

I haven't tried this but it should work: Use capacitors or transformers to couple audio oscillators or mechanical buzzers to a pair of wires, or a single wire and ground. The receiver is earphones (high-Z or appropriately coupled). Full QSK, no switching required.

I have a photo of a Japanese VLF CW transceiver captured on Guam Island in WW2. It was used for communicating between caves and tunnels, and for directing artillery. The transmitter is a high-frequency buzzer, the receiver uses a coherer (!). The antenna was a very long wire which perhaps extended outside the tunnels. I don't know if it was grounded at the far end, as in earth-dipole communications.

The Japanese are traditionally famous for doing the unexpected in war. This rig not only communicated through the ground, but used frequencies unlikely to be monitored or jammed by the enemy.

Reference on Japanese radios of the war: _Popular Communications_, December 1988 p. 20.

Does anyone know of any references or previous tests done on common commercially available VHF antennas? In particular, antennas like Ringo Rangers, Huster G6/G7's, Station Masters, Telex/Hy-Gain VxS series, etc.? In particular, things like radiation patterns/radiation angle, gain, bandwidth, etc. The manufacturers give most of these figures in their handouts, but they probably aren't all that accurate from what I've seen.

Also, somewhere there is a book that talks about the design and "how to make your own" version of many of the popular antennas, including the Station Masters. Anyone know the name and/or publisher of this book?

This letter was forwarded to me by a friend to got this from another newsgroup (rec.humor ??) of which I have no access. No social ramifications are implied. (I just thought it was a funny letter too...)

Dwaine, N5HD

==

The following is an actual letter. The original was typewritten, and all spelling and grammar has been carefully left intact, including errors. I thought this was pretty funny.

To Mr. (name omitted)
District Manager for Alabama
Radio Shack
3300 N. Pace Blvd
Pensacola, FL. 32505

Dear Sire,
This letter is complain about the problems I have having with the ham radio model number 19-1101 I had got from your company Radio Shack. I had this shipped special to me from your store 1096 Eastdale Mall Montgomery Alabama. I was got this because I think that i would get transmitt furthur that I did with the TRC 217 40 channel walkie talkie.

The problem that had first was when I was going to hook this radio HTX-1000 to the antenna the conektor on the radio was wrong it wouldn't attach to my cable. I was able to hook it finally by making a small change in in the connektor. As soon as I tried to use it there was no sound coming at all. This happened for two days and I never did get to talk to anybody the whole two days. That day the cable company came knocking my door and said there was something causing problems at my house and disconnekted my radio from the cable line. you knew when i brought the Radio that I was going to use that for my antenne. You didn't tell me not to why not?

Next time I decided to put the HTX-1000 in my automobile I thought I would see how it worked their. I hooked it to my CB-antenna and at least I could hear people. But what happens now is no one wants to talk to me because they says you have to have a licencs to talk to them. Why? I dont have to have a licencs to talk on my CB. They'll talk to me there. Anyhow it dont matter much anymore because somebody done took the radio HTX-1000 from my automobile.

What I would like for you Radio Shack to do is refund my money because I don't have the radio anymore and its not my fault i dont and I think you should give me back my money. Also the cable company here says that I hurt something in there line and want to be paid fix it. It will cost $27482.98 to fix the equipment they say was damaged because you didnt tell me not to hook it to the cable. Please remit to me the check for $27758.53 for damages due. To save this matter from going to court the check must be in my hand by June first or I will turn this over to my attorneys of law.

Thank you

Try Shunt Feeding your Tower!?

Hello DXers!

Some time ago I read some very interesting articles about shunt feeding towers. After reading through some material I understood how it works. Shunt feeding a tower is not at all difficult and seemed to give very good results.

I decided to use two one inch tubes rods in parallel for the gamma section (to make it broadband) up to the top of the tower, fed through a series and a parallel capacitor at ground level. The tower is 60 feet high and holds a TH6DXX and a 402CD (2el 40-m-Yagi), so the top capacity provided by those two antennas would certainly have a positive influence. The gamma section was connected to the tower just below the lowest antennas, at about 50 feet. About 3000 feet of radial wire was buried to keep ground losses low. Finding the right positions for 80 and 160m took a little longer than I had thought, but I managed it. I later calculated the impedance of the tower from the settings and this was well within the theorhetical predictions. So far so good ...

First thing that happened when I wanted to give it a try on 80 this night was that one of the 12-V power supplies went up to around 22 Volts and almost damaged the 70cm radio. The rotor control jumped around like crazy and everything was 'hot' in the shack. No doubt: RF.

The shack is about 50 feet away from the tower and it is below the ground level (in the ceiling). The outside of the coax cables coming down from the tower carries the RF. How to get rid of the RF on the cable? I buried the cables under the tower. They now disappear in the ground below the tower and come out of the wall in the shack. But the RF is still there ...

I could think of big ferrite cores but where can I get cores that are big enough for RG-213?

Any other ideas?

There are *lots* of things that can go wrong with a supposedly stable VFO!

> I also had the VFO tank toroid lying down on the ground plane, and my
> books disagreed about whether or not the "self-shielding" capability of
> toroids went quite to such an extreme; the Mark II had the toroid vertical
> and well away from other components.

The self-shielding probably wasn't the problem, but the stray capacitance between the windings and the groundplane will definitely cause frequency instability over time and temperature. Either standing the toroid up, or supporting it well above the groundplane with a *thick*, stable insulator should help.

> The most likely killer, however, was trusting Active Electronics "NP0"
> capacitors; they list the AVX part numbers that specify NP0 characteristics
> for some of their capacitors, but the circuit got a *lot* better when I
> used ceramic disks with the little black mark on top...

I haven't seen a problem with the monolythic multilayer NPO capacitors, I wonder what is going on. Another problem area is the temperature coefficient of the toroid core. Even with carefully selected compensation capacitors, the circuit will be less stable than the equivalent air-core toroid.

When desiging a VFO for a portable radio, be sure to use a mechanical dial to indicate frequency. It's just too frustrating to see the frequency wander back and forth on a digital display ;-)

> To which I might add: Homebrewing is being surprised.

Amen to that. But for me, anyway, it is also more fun than actually using the stuff, once built. I tend to make a contact or two with my new piece of gear, then say "Well, it works!", and let it gather dust from that point on.

I am in the process of getting my Novice license. I know little about antennas and would like some advice.

I would like to get an antenna system that would enable me to use my Novice frequency privileges to the fullest extent.

My limitations are that the maximum length of dipole would be about 70 ft. Large non-dipoles are out as well as a lot of different dipoles (multiple). This is due to my location.

Is there a small non-dipole or a 70 ft. dipole that could fit the bill?

Thanks,

Jim Allen

Several others have (politely!) pointed out my error as well. For my
traditional whining excuse and attendant rationalization, Let me say this:

Well, I looked in the 1988 ARRL Handbook, and waded through the U.S.
allocations. They didn't have the subbands plainly marked, but I thought
I could decipher the page-and-a-half of "limitations". I guess I couldn't!

Why doesn't the handbook show the bandplans? They don't change *that*
often! (or do they?)

-Paul -wb6cxc, *not* operating in the 80M Novice band (thank goodness!)

I'd like to hear from anyone who has some experience with the working of the `electret' type microphone. I've built an adaptor, to allow me to use the headset from my 2 meter FM hand-held with my Tentec Paragon HF transceiver, and am having some difficulties with high distortion.

The Paragon (since Tentec sells electret microphones) has a low-level (about +8.4 VDC through 680 ohms) voltage available on one of the pins in the microphone connector. In a `universal' (small universe) adaptor box that I've built, I'm providing a portion of that voltage to the headset's connector, with a DC blocking capacitor in the audio output.

A long time ago (but not so far away) I can remember reading some of the early `this is how they work' articles regarding electret microphone elements. `Back then' (as I remember), the early electrets were basically a charged film suspended between two `screens'. A sound wave caused the film to vibrate and, since it was electrostatically charged, the mechanically vibrating film induced an AC voltage across the `screens'.

Rather more recently (the last few months I think) I saw something on electret type microphones, and I believe (can't quite remember enough of the article to be sure) that the inferance was that current electret microphone elements incorporate a pre-amp within the housing of the microphone.

If electrets do now incorporate internal pre-amps, then my problem is most likely that I've just dropped the DC voltage too low, and all that needs to be done, to cure the high distortion, is to reduce (perhaps eliminate) the series voltage dropping resistance, so that the electret's internal amplifier is operating in its linear region.

I was cutting back (using series resistance) on the voltage, to try and set the electret's audio level to be comparable to that of my normal station microphone (so I wouldn't have to fiddle with the microphone gain on the radio). If the electret is a simple `charged-film' type device, then dropping the `polarizing voltage' should work to reduce the audio output. If there's an active amplifier within the microphone itself, then obvously dropping the impressed DC voltage across the element is not the way to reduce the audio output level, and an attenuator (isolated from the DC supply voltage) is called-for.

Typing this now, it seems reasonable that a simple `film-type' electret element would show very high output impedance, and therefore the higher than expected (compared to my regular microphone) audio levels are a strong indication that there is some internal amplification being provided within the electret housing.

Last night (Well OK, it in the wee-hours this morning), after several hours of checking-and-rechecking the wiring in my `universal mic adaptor' box, it was not nearly so obvious what was probably going on.

The interface box serves to provide for 4 different types of microphone connectors, and also as a switch, to allow me to select either a microphone, or my PK-232, as the audio input to the radio. So, even though audio interfacing to an HF radio is pretty straightforward, there can get to be a fair number of wires going all over the place. Putting it all into a small diecast aluminum box, and working too many hours, can result in a situation where `obvious' things are not ....

Thoughts & comments would be appreciated.

Oh for Christ's sake: WHAT IS WRONG WITH comp.binaries.* and comp.sources.* ????

I challenge any and all of you to convince me of any added functionality we would obtain by not using the existing and proven methods for distributing software via the net.

REPLIES VIA EMAIL ONLY!!!! I will summarize.

Absolutely correct.  Also, this site won't carry or forward "binary" groups.
The crackers and virii-villains have screwed it up for the honest hackers
(as usual).

Just remember, before he posted Super Morse, he explicitly asked the net whether or not he should. The response was overwhelmingly positive. He only did it after this response. Where were you when he posed his question?

Does anyone know the historical origin of the assignment of callsign prefixes to various countries? Example: why did the USA get assigned W, K, N, and part of A? Instead of some other letters? I can see A, for America, but what would W match? West? Or (most likely) was the assignment at random?

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

I have been monitoring 145.825MHZ the last week and have not heard Dove.
Is this bird still flying? What is the schedule for the Digi-Talker?

In article <2523@naucse.cse.nau.edu> rrw@naucse.cse.nau.edu (Robert Wier) writes:

> "I have a question: If novices were required to use crystals to generate the xmit freq, and assuming that you don't have a really big selection of frequencys (i.e. crystals), then how would you go about answering a CQ? "

Back then (as WH6FON), I had quite a few crystals... probably a half dozen or so :-). Several on 15M, a couple on 40, and one or two 80m ones. 15m was used primarily as I recall. Remember that other novices had the same restrictions, so standard operating practice was to tune around your frequency a fair bit. Also, back then, it didn't take ten turns of the frequency dial to tune 10 khz (I exagerate to make a point). Also, "most" operation tended to be in particular areas of the novice subsegment.

In fact, I tended to use only ONE crystal for most contacts, and had no trouble (for a 12-13 year old) making lotsa contacts. Trivia quiz: what issues of the Pop'tronix did my picture show up in?

I had dymo-labels on the top-end of my crystals for quick frequency changes (ft-243 crystals were on the large side, and had plenty room for labels).

I used a HT-40 transmitter during my novice days (as well as a string of home-brew transmitters and converted ARC-5 stuff).... sigh... the junk I used to have.... :-)

You "one-wire" guys are spending too much time and money trying to communicate! Better to use no wire at all and get voice transmission, to boot! How? Laser beams? No-o-o. Light pipes? No-o-o. Just take an couple of

empty cans, some string and some wax. Wax the string, punch a hole in the
closed end of each can. Run the string through the holes and knot each end;
[C
Pull string taut and presto! Wireless, no-power voice transmission!

Awhile ago I was in a radio store and I was reading through a magazine. I came accross a neat article, but I ended up not buying the magazine and then forgetting about the article. Now I find that this article might be very useful to me. Murphy's law... Anyways if you recognize the article that I am about to describe then please E-mail me. I would like to know the name of the magazine and the issue date. I would also be willing to pay for you to send a photo-copy to me.

The article described how to build a cheap video frame grabber for the Commodore 64 computer. The author was using the video digitizer as a sort of cheap slow scan TV system by transmitting the bit map via packet radio. I thought that the quality was rather poor, but the entire circuit was very simple and inexpensive. The article included a grainy picture of the author in his ham shack. I think info was included for ordering kits and PC boards. The surprising thing was that I have seen audio digitizers that looked more complicated than this video digitzer.

I am pretty sure that the magazine was Ham Radio, but I can't be certain. The issue date was late 1988 or early 1989. The local library does not have this magazine (or any other radio magazines).

If you can help, Thanks.

I just received a Kenwood R-2000 and would like any mods for this unit. This includes (but is in now way limited to) homebrew VHF converters, mods to go lower/higher in frequency, ect....

All serious replies welcomed. Please e-mail and I will post a summary if there is interest.

I just heard that the shuttle flight has been scrubbed. Again it was due
to hydrogen leaks. Columbia's mission may be set aside so that
Discovery's October launch of the solar probe will happen on schedule.

I had a free initial introductory offer to Genie and used my free hours up pretty quickly. If you are looking for ham radio and computer related stuff to download, it was a pretty good service. Anything that charges per minute is too expensive for me and I have found that I almost never use the software I do download. Most of the other interesting stuff on Genie cost extra money (stocks, news, etc.) and I am not into interactive CB channel stuff (wierd stuff), so that was all a big waste to me.

I have been using Prodigy for about a year and it is puny weak ham radio-wise. In fact, I wrote up a proposal for an expanded ham radio area and submitted to Prodigy HQ, but it was turned down. They are purposely (is that a word?) not targeting a techno/radio/CPU-nerd market (my words) and are going more for Harry and Hariet and Hillary Jr. Homeowner who have a home computer and got tired of putting recipes on it.

I actually enjoy Prodigy quite a bit, although I spend no more than 10% of my time in the ham radio area. Between work, packet, this stuff, and all my ham operating, enough is enough. I would rather read movie reviews or check stocks than download yet another morse code practice program.

Having not done any quantative work on these systems I wonder:

1) Do they work better with a button on the end of the string or is knotted string better.
2) How much improvment does the wax make.
3) What is the attenuation per unit distance vs string thickness/material.
4) Is it necessary to match the cans or does a larger can make a better transmitter or receiver.
5) How well does an oatmeal box do compared to a coffee can.
6) Are the "synthetic" material cans any good, how about the composite cans.
7) Are aluminium cans better than steel.
8) What effect does string tension have.

Ron, K3FR

Ok, did I miss something????  I heard that "they" were discussing this, but
I didn't know that it had happened yet (I don't think that it has).

  I have the 'need to know'... I am starting a Novice class the 25th of
September with the Derry (NH) Adult Continuing Education department.

  Please provide quotes that establish this.

> 73,   Dube   N5PDK

If memory serves me correctly, the principal advantage in retaining AM for aviation radios is that AM is superior to narrow-band FM for weak-signal detection. At low input signal-to-noise ratios, the output S/N ratio of AM will be superior to the output S/N ratio of FM due to the onset of spikes in the discriminator output (the FM threshold effect). Somewhere in one of my communications texts is a graph of the output S/N ratio vs. input S/N ratio of both AM and NBFM, and it does show the superiority of AM over FM for weak-signal work. Of course, now that I'm *looking* for the thing, I can't find it. The closest thing I can find is a graph in Taub and Schilling (Principles of Communications Systems, published by McGraw-Hill in 1971) which plots the relative output S/N ratios of FM (for several values of modulation index) and coherent detection of SSB or DSB-SC signals (see Fig. 10.1-1, p. 321).

This is probably one of those rare instances in which retention of old technology actually has a technical rationale which coincides with the inertia of a large installed user base.

>
> I too am very nostalgic for Heathkit. My first amateur rig was an HW-16 code only rig. Was a big deal when the regs changed from being rockbound to being able to use a VFO. I immediately bought the VFO (was it $75?), and had great fun since I COULD ACTUALLY TRANSMIT ON THE SAME FREQ AS THE OTHER GUY WAS SENDING! WOW!

I remember the HW-16; quite a nice three-bander (80,40, and 15), aimed specifically at the Novice licensee (75W, CW only, crystal-controlled or usable with external VFO). I remember helping a kid down the block put one on the air--he was awaiting his Novice ticket, and he wanted me to give the radio a checkout. Worked a GI3 while he stared, bug-eyed.

A friend with whom I keep a semi-regular sked sent me a photocopy of a Heath ad from CQ, circa 1968. It was a two-page spread; talk about nostalgia! I had actually forgotten how extensive was the line of Heath equipment. For me, whose source of income was mowing lawns, dollars were very hard to come by; what little equipment I could afford usually came from Benton Harbor.

>
> Anyway, I hope that Heathkit is picked up by a company that will find a way to keep the company going and make a profit. I still do buy stuff from them, although not usually not kits.

> Anyone else have old Heathkit nostalgia?
>
>
> - Bob Wier
>

From what I have written above, Bob, it is obvious that I do.

I guess I can put in a plug for the Heath SB-1400 transceiver, which is really a Yaesu 747GX with a few cosmetic changes (and the name Yaesu does appear in a few places in the radio itself). The price of the radio and power supply bought separately were rather steep, but the combination price was better than the prices for which I could buy comparable radios and power supplies. I have thoroughly enjoyed this radio and would recommend it to anyone. My only apprehension is that if Heath should withdraw from amateur radio entirely, service may or may not continue to be available. If the latter, I hope that Yaesu would be willing to service the radio should it ever need it. The best-case scenario would be that Heath would find a buyer actively interested in maintaining a presence in the amateur-radio market in the US.

I was wondering if anyone could tell me where I could find out what some of the different satellites listed in the NASA Prediction Bulletins are? I recognize some of them (such as some of the weather, the amateur radio 'birds', the Hubble Telescope, etc), but some of them are still unknown (and often cryptically named or not named at all). Is there some public information (or, even better, available online or via anon ftp) that has such information as this? Please e-mail and I'll summarize to the net.

Thanks in advance.

I had a simular experience. I went to a office supply place that also had
cards and such. After looking at the envelops I could not find the
european size envelops. I notices several empty spots and as the clerk about
the envelops I wanted. Again a blank stare. A freind of mine obtained
some at another store of the same chain. Turns out they are with the CARDS,
not the office supply envelops. Leason learned is don't look in the office
supply section for the european envelops, look in the greeting card section.
Also the clerks that work in these store dont know what a european sized
envelop is, all they know is they are the funny sized envelops they only
sell to the crazy people that talk on the radio late at night!

Has anyone heard anything, good or bad, about the Alinco 2m mobile rig? I forgot it's model number. I believe it has 45 watts and extended receive coverage. My one previous experience with Alinco (I bought one of their original 2m ht's) left a little to be desired. This mobile rig looks to be a good buy if the quality is reasonable.

Any comments would be appreciated.

I just passed the test for my ticket and am contemplating getting a nice TS440 to begin operations. However, I don't want to spend close to

$1200 on something that will be a warm paperweight. Not that that model's junk, mind you - my problem is environmental.

I live in Venice, CA, about three buildings away from a major boulevard that's got a nice line of high-tension towers marching down it. I can hear the corona discharge buzzing from my bedroom, and broadcast channels 2 and 4 are pretty "sparkly".

Just to test the waters I threw a rudimentary longwire onto an old Hallicrafters I have lying around, and was surprised to be able to actually copy a few QSO's. They all seem to be local, but that's not surprising. I didn't hear a great deal of hash. I got WWV OK.

The question: Can anybody give me some idea of what to expect in the way of a QRN spectrum from those #*$@(&$# HT lines? I mean aside from the cancer, that is...

I own the house so I can put up pretty much any kind of antenna - no covenants in a neighborhood THIS old! But if I can expect all DX to be wiped out, mebbe I better concentrate on running mobile.

Maybe we should ask the question: "why is NON-aviation NOT using AM?"

The narrower that FM gets, the less capture effect you get.

When two stations double on FM, they get all kinds of squeaking and howling noises, so the heterodyning problems of AM stations doubling is comparatively not so bad. At one time, land mobile and amateur FM was wideband, and the advantages of FM were good, and the frequency stability of small portable units was so bad as to need that much band width to even find the signal.

Today we have the technology to slice out the correct H3E or R3E signal, if we were to use these modes (H3E is AM with one sideband gone, R3E is H3E with the carrier reduced requiring a syncronous detector).

I guess that's what they stole 220-222 MHz for (narrowband use) but it seems that they have failed in making it work (UPS wants to use narrow packet, not ACSSB and voice).

Let's face it - none of us like to think about it, we hope it will never happen in our lifetime or that of future generations. But just in case, it's important to know...
Does anyone have any sources of information on radio propagation and effects on the ionosphere after a nuclear explosion or on a larger scale - during a "nuclear winter" ?
With all other services down, I would imagine Amateur Radio would be one of the only sources of communications.
Normally,I don't like bringing up old issues but while we're on the subject - was the context of the tape that was to be played on all Radio and television networks in the event of a nuclear attack ever made public either here or anywhere else ?

Rich

I've heard the navy wanted N, and apparently got it... all of it. The Army
(and later Air Force as well) were using A.

I guess that the US got stuck with some weird letters in exchange for having
so many letters.

On the other hand, all of M for such a small country? But then again they
were quite an empire at one time.

One can see some obvious things in some of the call prefix allocations.

We are not talking about Brians opinion, we're talking facts. It is
unfortunate that your narrow view of the world only encompasses
Usenet. If you investigated the history of rec.ham-radio, you might
be surprised at the number of people who receive this newsgroup
via email. You might also be surprised to learn that the mailing list
was around long before the newsgroup was. And yes, some people DO pay
real money to read this traffic. (I have to wonder why sometimes.)
How do you suggest that those "driven to poverty" "fix the problem?"

>It is trivially easy to screen traffic on
>the basic of a) size and/or b) content (the leading "M" in uuencoded

>Using Deliver, that would be a 15 minute task. Then the rest of us who

>value such postings could continue to benefit from them. Of course, it
>IS much easier just to bitch about it....

Alright John, why don't you prove your point. Since it's trivial,
write the piece of code that will screen out source and binary postings,
and mail it to Brian. Please ensure that your program catches C, Fortran,
Pascal, Assembler (680x0, 80x86, 65xx, 68xx, Z80, 808x, VAX, Sparc, IBM 370),
and BASIC, in addition to uuencoded stuff. Oh yes, don't forget btoa.
We'll test it by letting you post your code to rec.ham-radio after Brian
installs the filter.

>Most hams use PCs and for the non-PC software, a
>simple keyword in the title line will differentiate it from the PC stuff.

Do you have any hard data to back that statement up?

> This group would be an ideal place for Phil's latest TCP/IP stuff as
>well as all the other ham oriented software. Perhaps Bdale could even be
>pursuaded to set up an automatic poster daemon for the IP stuff.

Have you met my friend John? What a guy! Always willing to appoint someone
else to a job that will me his life easier! Tell me, John, do you know how
many bytes of traffic would be involved if we were to transmit every update
of NET and NOS (not to mention PE1CHL and the variants)? Get back to us
when you do.

It sounds to me like John's ftp command is broken. To quote my most
knowledgable friend, John:

">- let the people who have a problem with software in
>this group fix the problem for themselves."

>I say
>this, of course, because he stated a couple of years ago that it would
>take too much of his time for him to do so when I asked him to set up an
>automatic E-mail posting to me so I could redistribute to non- Internet
>sites.

So why didn;t YOU set it up?

>So here's my suggestion. In the interim, continue posting to rec.ham-radio.
>And in that interim, let's find someone to volunteer to hold a formal
>discussion and vote for a software newsgroup for ham radio. Any
>volunteers?

Ah yes. "I think we (sic) should do this!" "I think we (sic) should
do that!" "I want! I want! I want!" "Who's going to do it for me?"

Here's my suggestion:

John, shut the fuck up!

As far as I know, K is used by stations west of the Mississippi and W by those east of the river, with one or two exceptions here and there. And then Canadian stations uses prefixes of CN (I believe) while stations in other countries don't have any callsign. I do know one example though. In Taiwan, there is a station named International Community Radio, Taipei which used to be the american military broadcasting station has a callsign of ICRT. (It broadcasts in English, most of the time). Therefore, I think callsigns are only used by stations in North America.

Ben, DL6RAI

The decoupling effect of bringing your coax et al down to the ground level of the tower presumes that ground level is also rf ground level and thus no rf will be conducted. As you discovered, that is not always the case.

Your coax and rotator lines may be acting as radials. RG213 size ferrite cores are fairly common, available from most ferrite core manufacturers (e.g. AMIDON), RADIO KITs in New Hampshire, some RADIO SHACK stores and many stocking distributors.

You may also try creating an air core rf choke by winding the coax feedline - about 6-12 turns (the lower the frequency you are trapping out = larger number of turns), 6-inch inside diameter - to form an rf choke after the coax departs the base level of the tower. Another method I have found effective in years past is to electrically and mechanically bond the coax shield to the tower at the base. The tower base should be grounded with one eight foot ground rod per leg close to the tower and another eight foot ground rod per leg at least six feet away from the tower - all rods connected to the tower base with 3/8-inch copper tubing or #6 ground wire. Although a physical connection is not usually required, I have found occasion when working with a hot tower that bonding was the only way to achieve the decoupling. A coax feedthrough connector (a long double female device with mounting nuts - can't remember the connector number) works well for this purpose when mounted to a small piece of right angle stock that is clamped to the bottom of a tower leg. If you want to get fancy with this arrangement, this is also a good point to use a gas discharge tube lightning arrester in lieu of the coax feedthru.

Any one of these solutions may cure your problem or all may be required. And there are no guarantees! Good luck and 73,

Wayne, KB6CSP

I don't know how the assignments were made, but I presume they were at an international level *above* simply a telecommunications organization, because they're used for more than radio/TV callsigns.

This first dawned on me last year when I saw a Thai Air plane with an "HSxxx" number. Of course, I'd been seeing "N" on U.S. planes for years, but it never occurred to me that there might be a link between those ID numbers and the "N" used in ham prefixes.

So I await a definitive answer, also. Seems like it must be a "higher authority" than the ITU--or at least a joint agreement between the ITU and some other international organization(s).

Patty

Q
Hi!
I am trying to find out the QSL information for N1HAQ. I can't get a response from the datapoint call book, and I don't have easy access to a regular call book. If anyone could provide me with this information I would be very grateful. I imagine N1HAQ would also be pretty grateful. I had the honour of being his last state for the WAS award. I would really like to get a card off to him ASAP.

I believe there is also a call book available via FTP, we just got FTP access. Does anyone know about this?

Thanks in advance,
Andy Greenshields N3IGS

Aha! another plane spotter! Ever since my kid days, I have been straining my eyes in movies that featured airplanes to see if a movie was indeed taken on location. Much fun. Also at airports.

Of course, back then, when you spotted a VS- plane you don't really know which of the six colonial outposts it was from. I never bothered to look for the HS/s -- too common a sight at the local airport :-) :-).

BTW, HS probably got assigned because at that point the country's official name was Siam.

I have Larson 2M and 220 glass mounts on the back window of
my Subaru, directly across defroster wires, strategically placed
to avoid the windshield wiper and low enough to get through my

low garage doors.

If you are pay excruciating attention to cleanliness and get the glass warm (blow dryer) and dry before mounting, you should be able to match my installation technique. My 220 has been on the car 2 1/2 years and the 2m for 2. The 2m was actually mounted first but turned out to be defective, something we discussed here a year back. Larson's advice was to place the mounting base straddling a defroster wire, so that maximum cancelling took place.

Practically speaking, I have never noticed effects from the defroster wires, but I do notice junk from the rear wiper motor, which could be fixed if it rained in California occasionally.

Watch out for subtle curves in the glass, if you cannot place the straight edge of a ruler flat in all directions on your chosen location, find another location. Adhesion will not be very good and moisture will get in.

Read instructions very carefully, when they say clean and warm, they mean it.

Finally, I got a chance to test how strong the mounts were through stupidity. I drove through what I thought was a police line of yellow plastic tape. It turned out to be 1/2 or 5/8 nylon rope. That rope went over the roof of my car, dropped down the back between the window and the element of the glass mounts, right near the base. It twisted both elements horribly together and then came unhooked. I stopped expecting to sweep up glass because of the terrible noise. The mounts remained attached to the glass and are still running today almost 2 years later. I do find I buy new elements every 18 months or so.

Brian Perkin
N6RSW

P.S. Everyone I have ever talked to has found the Larson elements to be too long. Expect to do some trimming, in the range of 4 or 5 inches on 2M. If you put the antennas close together, they will interact. That's another reason I bought new elements, but that's another story.

Yeah, that's about right. The procedure was to call a LOOOONG CQ and then spend several minutes "tuning the band" looking for a response.

You got to know really well the other Novices who had crystals on the same frequencies as yours!

If you're going to be posting programs, why not post them in SOURCE form. That way others can learn from the code, and have a chance of running them on a multitude of different platforms.

You know, "software" homebrew..

Besides, with all of this virus crap running around, I wouldn't run a program that I didn't compile myself on MY computer..

> antenna tuner without causing damage to the rig or myself!

Point #1 is not to try to tune up a Swan 500 to its rated 500 Watts! They are driving the pants off the sweep tubes at that level. Most Swan 500 users limit themselves to about 350 Watts input, which should give you pretty close to the legal limit for Novice/Tech anyway (200 W output).

As I recall, the Swan 500 is a conventional PI-network output. The traditional tuning method is first to turn the plate loading control to minimum (counter clockwise). Now set the function switch to "TUNE" (or go to "CW" and press the code key, I forget how Swan does it) and increase the drive slightly until you get a small increase in plate current. IMMEDIATELY adjust the plate tuning control for a *DIP* in plate current. Never allow significant plate current to flow with the plate tuning misadjusted.

Now increase the drive control all the way and increase the plate loading control. The algorithm is to keep increasing plate loading (which increases plate current) while re-dipping the current with the plate tuning until you reach the desired input power level. (Input power = plate volts times plate amps.) Now decrease drive level until plate current just begins to drop.

On SSB, adjust mic gain (drive level) until the ALC meter reads slightly upscale on voice peaks.

I am interested in obtaining a crystal filter for a homebrew IF project. I would prefer a 10.695MHz as used in the Kenwood

TR-751, TR-851, or the 16.3MHz or 16.9MHz used in other Kenwoods. I feel the simplest way to get one is to order one as a repair part from the manufacturer. The application is FM, and I would appreciate any info with Manufacturer, radio model number, and part number for the filter. Any make/model and frequency between 10 and 18MHz will do. Thanks in advance....KM4JN

(hint: its a DSP modulated DDS project).

I'd like to get some references on articles covering stepper motors, both how they work, and practical `how-to' information.

As of this time, here are the sources that I already know about:

Publication	Issue	Page	Comments
Sky & Telescope	May 1989	554	"Gleanings For ATM's"
Electronics World + Wireless World (`WW')	June 1990	527	"Circuit Ideas"

I'm hoping that someone will know about a series on stepper motors that's been run in one of the electronic magazines. References to readable books on the subject would also be appreciated.

If anyone cares to repond to this query, it would probably be better to send the information directly to me, so as not to clutter-up the Digest with information that's not of general interest.

Thanks,

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com

Actually, I would guess that the nutshell qualification for homebrewing is that the project should require debugging (at least potentially, for those who actually get things right the first time). (Though we should exclude the complete incompetants who can't connect anything together, otherwise the folks who couldn't operate a split-VFO ricebox during the infamous Bouvet Island incident would be "homebrewers" :-).

For example, someone opined that just building a kit or a magazine project isn't really homebrewing. To some extent that is true, but frequently kits require some debugging as well, which requires you to actually try to understand what's going on in the circuit. I bought a QRP transceiver kit some time back which never worked quite right (VFO instability when transmitting), and I had to screw around with it for quite some time, trying different buffer amplifiers, shields, etc., before rendering it completely unusable :-S... A more "pure" example of homebrewing would be my current project; I built a 10MHz VFO (the 7MHz VFO from the QRP Notebook; I didn't change the circuit itself, but I had to derive the correct capacitor and inductor values, and discovered a couple of minor problems not discussed in the text). The first VFO turned out to be rather unstable when checked with a frequency counter; so I poured over all of my references, and listed a number of things that I seemed to have done wrong*, and built a second copy, which performed much better -- though still not good enough, so I will have a third go around (at least), this time with some notable changes in the circuit itself. Despite still not having a working VFO, I've learned a lot from it, (indeed, things I couldn't really learn from the references at hand [see below]) and that's the point.

* For example, I used a cheap double-sided PC board for the first one, and one reference says that having a ground plane like that will result in lots of uncontrollable temperature-sensitive capacitors (of course, another reference says that double-sided boards are fine for VFOs), and that you should

use fiberglass-epoxy; the second try used single-sided fiberglass.

I also had the VFO tank toroid lying down on the ground plane, and my books disagreed about whether or not the "self-shielding" capability of toroids went quite to such an extreme; the Mark II had the toroid vertical and well away from other components.

The most likely killer, however, was trusting Active Electronics "NP0" capacitors; they list the AVX part numbers that specify NP0 characteristics for some of their capacitors, but the circuit got a *lot* better when I used ceramic disks with the little black mark on top...

> out of your own brain/junkbox/workbench!

Hey, what's wrong with 100mW? Didn't you see the fairly recent article in QST about QRP operation, where they talked with one guy who is working on WAS with a 50mW rig? And who once used a 400x (CMOS inverter, whatever the number is) as his oscillator and "P"A? [Take this complaint with a small grain of salt, of course; there is obviously room for KW rigs in the homebrewing world]

> I'm with Myron: Homebrewing is building something, not connecting

RE: local Channels in your cable TV system for ham use.

I have seen similar things done. Several options apply.

1. Using a VCR output, the composite video was added to the system through the same type of splitter that one would use to hooke one cable to two TVs. I have seen some back feed from this into the system, so you may want to put an amplifier before the splitter/combiner to prevent unwanted viewers.
We used this system in Alaska in a dormitory to have our own 'blue' channel.
(This will only work if channel three or four is not in use already).

2. Buy or build your own modulator for the channel of your choice, preferably one not used by the existing system. Use a combining amplifier to add the channels together.

Depending on how much you want to spend, you can get real extravagant with this. Commercial notch filters are available which will completely remove an existing channel, such as a scrambled pay channel you do not subscribe to. you can then add your channel over it. Modulators are expensive. We have two of them in a local application which take either seperate or composite video/audio inputs and provide an output on any cable or broadcast channel. They ran about $800.00 each.

I have seen one ham application in use where the individual used a VCR and fed the output of a Commodore 64 into the video in for packet and his scanner output into the audio jacks. He then hooked it through a radio shack splitter to his cable system. This allowed him to record up to 8 hours of scanner/packet, plus view it and hear it on a small b/w TV in his living room.
This worked quite well. In fact, I plan to do something similar in my house.

Good luck.

73,
Michael

NO! NO! NO!!! The 80 meter novice band is from 3.7 to 3.75 MHz. Don't
try this at home kids!! (besides, the noise is *terrible*!!!, and you'll
give the neighbors a bad case of TVI).

I'm one of those previously rock bound old farts (37 yrs old type).

When I called CQ, I used to tune around my xmit freq. a few hundred cycles or so. I only answered CQs if I had a crystal very close to the transmitting frequency.

Most novices I knew had a good supply of crystals and a VFO shoved off somewhere in the shack..... but then, that's another argument.

]These guys have been an international disgrace to this country for a long time.

Just because they got an NAL doesn't mean they have to pay it. They can
challenge it in administrative law court, and ultimately appeal to
the US courts. Of course, at this point there's not much way out
other than something that will cost.

However, I have seen an NAL thrown out just from some jawboning, so
it still isn't final.

I do hope they get the bastards, anyway.

can anyone tell me if the KENWOOD TH-27 that will be sold
in the U.S. will be the same as the TH-F27? I have seen a
book which shows two *very* simple mod.s to get the TH-F27

to XMIT from 136-174 MHz and RCV 118-174 *and* 290-400MHz.
The RCV 118-136 and 290-400 was shown as AM. This radio
looks like the one I've been waiting for...it would be nice
for air shows, etc. Now, can anyone tell me if this is all
true? If not, does anybody have any recommendations?
Thanks in advance.

Just as an added extra comment, my understanding of how FCC works is
as follows. The FCC will not publicize someone receiving a Show Cause Notice.
(commonly called a pink slip ;-) Once the individual receiving the
pink slip doesn't respond or continues along their merry way THEN
they receive the forfeiture. This is when the information will finally
become public knowledge, i.e. if you find out about the forfeiture
it means a real fine.

There is a good chance I will be in Japan early next year on business.
I have the ARRL info on amateur radio operation in Japan. Has anyone
on the net actually operated there? I would appreciate first hand
information on operating 2M and other bands in Japan.

E-mail responses to me.

Bob

copied from packet:
From: n2kzh@kb1bd.nj.usa.na (Bryan Todd)

THIS MOD IS FOR THE ALINCO DJ-500T, IF YOU HAVE LITTLE OR NO SOLDERING
EXPERIENCE DO NOT !!! REPEAT DO NOT TRY THIS MOD ON YOUR RADIO. IT IS
NECESSARY TO REMOVE A CHIP RESISTOR FROM THE CPU BOARD.

```
TOOLS YOU WILL NEED: # 0 PHILLIPS SCREWDRIVER
              25 WATT SOLDERING PENCIL,
                     EXACTO KNIFE.
```

I RECEIVED A SCHEMATIC AND BOARD LAYOUT FROM ALINCO FREE. PHONE 1-213-618-8616. OR SEND A SASE TO ME AT : BRYAN TODD 318 ALDRICH ROAD HOWELL, NJ 07731 AND I WILL SEND YOU A COPY OF THE BOARD LAYOUT.

1. REMOVE THE BATTERY PACK
2. REMOVE 3 SCREWS FROM THE BACK OF THE RADIO
3. REMOVE 2 SCREWS FROM THE BOTTOM (FRONT PANEL SIDE)
4. SPLIT THE CASE CAREFULLY.
5. PUT THE RADIO FACE DOWN ON THE TABLE WITH THE TOP AWAY FROM YOU. THE SPEAKER AT THE BOTTOM.
6. FIND THE "D" SHAPED GOLD PADS UNDER THE SPEAKER ON THE RIGHT SIDE OF BOARD.
7. THE CHIP RESISTOR IS TWO PADS UP FROM THE "D" SHAPED ONES. THE NEXT STEPS CAN CAUSE GREAT ILLNESS TO THE RADIO !!!!!
8. VERY CAREFULLY HEAT ONE END OF THE CHIP AND PRY WITH KNIFE.
9. THEN HEAT THE OTHER END AND REPEAT UNTIL RESISTOR IS OFF THE BOARD.
10. HOLD THE BATTERY PACK IN CONTACT WITH BOTTOM OF RADIO, TURN ON RADIO, PRESS THE RESET BUTTON WITH TOOTHPICK (HOLE UNDER PTT SWITCH).
11. CHECK THAT YOU HAVE THE NEW FREQUENCIES THEN REASSEMBLE THE RADIO.

YOU CAN NOW PROGRAM
130.00 MHz TO 169.995 MHz
340.00 MHZ TO 379.995 MHz
420.00 MHz TO 469.995 MHz
870.00 MHz TO 899.995 MHz

WARNING !!!!!!! TRANSMITTING OUT OF THE HAM BANDS IS ILLEGAL !!!!!!!

SINCE YOU HAVE THE SOLDERING IRON HOT YOU CAN BUILD A NICE ACCESSORY. REMOTE MICROPHONE AND SPEAKER.

TO MAKE A CABLE YOU HAVE TO BUY:
1/8" STEREO PLUG "RS #274-284"
1/8" TO 3/32" STEREO ADAPTER "RS # 274-373"
10 K OHM 1/4 WATT RESISTOR "RS # 271-1335"
10 MICROFARAD 35 VOLT CAP "RS # 272-1013"
MATE PLUG FOR YOUR SPARE MICROPHONE.
PLASTIC MINI BOX.

I MADE ONE WITH A 8 PIN STANDARD MIC PLUG SO I CAN USE MY SPARE HAND MIC IN THE CAR WITH A 6" SPEAKER.

SPEAKER MIC CONNECTIONS:

SHELL	GROUND
TIP	REC AUDIO
RING	PTT & AUDIO IN.

CONNECT SHIELD, PTT COMMON AND SPEAKER COMMON TO THE SHELL. CONNECT SPEAKER PLUS TO THE TIP. CONNECT A 10K OHM RESISTOR AND 10 MICROFARAD CAP TO THE RING. CONNECT THE PTT SWITCH BETWEEN THE SHELL AND THE 10K RESISTOR. CONNECT THE MIC PLUS TO THE 10 MICROFARAD CAP. NOW YOU CAN

USE A REAL SPEAKER AND REAL MICROPHONE. THAT WILL ALSO WORK FOR PACKET
BUT USE A .1 MICROFARAD CAP NOT 10 MF....

```
   |_____| SHELL
     | |

     | |  ring

      V   tip
```

WELL THATS ALL FOLKS......... 73'S FROM BRYAN (N2KZH)

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

I am a "Younge Pharte", but ...

back in those good old days, it was common to listen to wider and wider
chunks of spectrum for replies to your CQ, until you in fact were
listening to the entire novice band. After listening to the entire
novice band, and not hearing any replies, you would call CQ again.

To all my net-elmers, Thanks! I passed my novice exams!

I dropped in to a local code class to introduce myself and spend some time studying with like minded people rather than staring at a computer speaker.

At the end of class, some folks were taking their exam and the rest of us were invited to take it for training. When all was said and done, I had passed with the highest sequential number of characters (183) of anyone taking the test!

The novice written went much the same way, although I missed 8 questions. 9 would have failed me. Since I hadn't studied, I was surprised and pleased.

I'm sure I did as well as I did only because of the invaluable information your folks are constantly posting. Thank you again!!

I'll take the technician written in two weeks.. and then off shopping while I wait for the Feds... I'd like to ask for advise on HTs for emergency service when I get a better handle on what that requires.

Regards,

-Rick-

That sounds more like a newsgroup ABOUT software. Let's stick with a
traditional rec.radio.ham.bin.

Until after World War II, when precision military surplus components made variable frequency oscillators economical, the majority of operation by amateurs of all classes was crystal controlled. It was the universally acepted practice during non-net operations to tune around for answers to your CQs. Often, to make it easier, the calling station indicated where he was tuning ("here to 3600", "plus or minus 10". etc. All abbreviated. of course.).

Incidentally, the term precision components is no misnomer. The old "Command Set" radios out of B17 bombers actually had jeweled bearings in the VFO capacitors.

>725/726) but felt that the kenwood had more features:
>
>100 memories (I use memories alot; I've already used 10 which is the alotment
>you get on the yaesu);

The 735 has 12 memory channels, but I don't use memories much in my style
of operating.

>
>RIT/XIT display (the others have RIT but no display;
>I didn't like the way ICOMs RIT worked, same goes for the CLARifier on
>the yaesu); (Do the ICOMS have SPLIT operation? Does the RIT

>to work SPLIT [with freqs more that 1.2 khz apart] just using RIT with
>the 440.)
>

The RIT control on the 735 is plus or minus 800 hz with no display
indication. The 735 allows split operation between VFO A and VFO B.
Since the VFOs also store mode options, you can work crossmode as
well as crossband. A second press of the SPLIT switch puts you in
reverse split.

>The 735's controls for mic gain/VOX control were under the little front
>panel door which I found difficult to get too;
>
>However, the 440 has the vox controls on the rear, which is not good,
>it is o.k. because I don't use VOX that much;

I removed the little plastic door on the 735 the first day. It serves no
purpose and can drop open when running mobile in the Jeep.

>I wanted 10 hz freq readout which you get on the 440 after snipping a diode;
>
>I think ICOM has this but was told that the yaesu doesn't;

The 735 does not have the 10 hz digit available on the display. The mode
indicators occupy that position...pity.

>When changing modes on the yaesu you have to cycle through
>usb->lsb->cw->am->fm->back to usb....which means if you want to go from

>cw to usb you have to go through fm which generates alot of noise in the
>speaker;

The 735 has individual switches for each mode. That's nice, I hate the
Yaesu system too.

>The tuning feel of the yaesu and the ICOM is better than the kenwood; sometimes
>I think the kenwood does not have enough revolutions per kilohertz; what I
>mean is that for a very small change in the dial you get a change of about
>200 to 300 khz. I know of no way to change this. On the Icom and yaesu
>when you turn the dial slowly it only changes about 50 to 100 khz.

Yeah this is a major plus of the 735. The tuning rate varies with the speed
that you turn the knob. Also you can adjust the drag on the knob to suit
your taste. I set it tight for mobile and loosen it up for base use. Very nice.

>With the 440 you can get a 1.8 khz wide SSB filter which I find essential
>for working 20 meters. I don't think this is available on yaesu or
>the ICOM 735/725/726.

Optional filters are available for the 735. I have the 1.8 khz SSB filter
and the 500 hz CW filter in mine.

>The kenwood has AFSK ports which I use for RTTY, AMTOR, and PACKET.
>I think that you have to use the microphone jack on the ICOM; the
>yaesu may have an AFSK port, I am not sure.

The 735 has a connector called ACC1 which has PTT, audio in, audio out,
squelch status (goes low when squelch opens), 13.8 volt power, ground,
and ALC in. The manual recomends connecting AFSK equipment here, though
you can use the mike and speaker jacks if you wish.

Also on the rear panel are the beloved transverter jacks and the external
receive antenna jack.

>Of course the 440 is about US$ 100 more than the ICOM or yaesu. The
>auto antenna tuner is another $200.

Icom offers the AT150 autotuner as a standalone box and the superior
AH1 which places the tuner at the antenna where it belongs. The coax
line is always flat. This thing is expensive, but it is done right.
Me, I use a cheap MFJ901 for portable and a Dentron MT3000A for base
because I like twiddling knobs. My Drake twins had real TUNE and LOAD
controls built in....pity they disapeared on the new rigs.

>I had a small problem with my 440: It made a very faint clicking noise
>when turning the main tuning knob. It turned out that the optical
>encoder had a small mechanical problem with it. Kenwood is sending me
>a new optical encoder at no charge, but in the meantime I was able to
>fix the instlled one.

No problems, yet, with the 735.

>There is a new radio from ten-tec called the Delta-II. It is a 100 watt
>(maybe 150 or 200 watts, I don't recall) HF transceiver with 100khz to

>I wish I had it in the kenwood. The Delta-II is supposed to be available
>in november. If the price was right and available today, I might get
>one.

The Delta-II is supposed to sell for around $1300. The 735 has passband
tuning and is as quiet as a TEN-TEC Corsair.

3.58 Mhz is not in ANY ham band, thank goodness, or there would be incredible TVI problems. The standard procedure in rockbound days was to send looong CQs and looong answers with the entire novice band being tuned for replies after each CQ. Needless to say, split operation was the order of the day, tying up two frequencies for one QSO. Tuner-uppers were a constant problem and often you would turn over and find that another QSO had started on the transmit frequency of your contact.

> meters, and is presently preparing a petition for rulemaking on the
> matter.)

Narrow band modes are not necessarily the best way to work weak signals.
witness the ability to copy spread spectrum signals below the noise
floor. Closing this spectrum to weak signal techniques other than CW,
SSB, and AM(!) would be a mistake we could live to regret in the future.
Restricting ineffient modes such as conventional FM and AM from this spectrum,
might be acceptable.

>I am aware of the comments filed by the American Radio Relay League and
>generally support them, especially in their reaffirmation of their
>recommendation that codefree license privileges begin at 220 MHz. I do
>not, however, support their acceptance of the name "Communicator" (their
>original proposal), for the reasons outlined in my comments filed on
>this docket. I also do not see a reason for a power limitation of 200

>communication on the satellites, usually entails the use of expensive
>commercial equipment.   In fact; it is interesting to note that Mr.

To put the expense argument in perspective, only about $200 separates a CW satellite station from an SSB satellite station. The transverters don't care, only the amplifier needs to be linear. You need a good SSB quality receive setup in any case.

>Karn, despite his close and valuable association with AMSAT, makes only
>passing reference to satellites. Other VHF/UHF applications of code,
>the existence of which Mr. Karn ignores, include long haul tropo and

>necessary on the UHF and microwave bands than on the lower VHF bands.
>On at least one occasion, I have been frustrated in not being able to
>work a low power station on 1296 MHz about 120 miles away, because his
>station was not set up for CW operation. I am convinced that codefree

We're all certainly sorry that W3XO was "frustrated", but a codefree licensee could equally claim to be "frustrated" because W3XO doesn't employ DSP techniques. If you want to play the DX game then you must be prepared to meet the DX on his own terms.

Forcing ALL amateurs to know code so that YOU can work them using code is an incredibly selfish attitude.

>licensees will certainly be at a disadvantage on any bands they occupy,
>unless they are satisfied to limit their activities to relatively short
>haul voice and data modes, generally based on the use of FM.

If this were true, which it isn't, then THEIR limitation is THEIR choice and shouldn't concern you. Fortunately, techniques for weak signal work which have been repeatedly demonstrated to be superior to make and break keying in the space and military sectors are becoming available to the average amateur at reasonable costs.

>Another, who does not appear to understand what really goes on on the
>bands above 50MHz is Brian Kantor. He begins his argument for granting
>codefree licensee use of all bands above 30 MHz with the premise "Since
>Morse code is rarely used in VHF and UHF communications..." Surely,
>basing a position on such an erroneous argument should be grounds for
>ignoring the remainder of his comments. Nevertheless, I will deal with

I would consider a few hundred contest DXers using CW a few weekends a year as being fairly called "rare" when considered as a percentage of total usage on the VHF bands.

>the past. Mr. Karn, Mr. Kantor and many others, who seem to think that
>VHF/UHF operation is limited to FM and packet (also FM), ignore the
>impact of turning lose an additional hoard of FMers on 2 and 6 meters
>without some kind of protection for weak signal narrowband modes. Mr
>Kantor compounds his lack of knowledge by the following statement:
>"Even the traditional advantage of Morse for weak signal communication
>no longer holds true: digital signal processing techniques have yielded
>communication systems which can be built by the ham experimenter that
>will provide reliable communications at received signal strengths far
>below those at which the human ear can even discern that there is a
>Morse signal present." THIS STATEMENT IS ABSOLUTELY FALSE. Some day,
>it may be true. Many VHF operators hope so. There have been many
>promises over the years for such a utopian scheme that would make
>moonbounce available to the "average" VHFer (100 Watts and a 12 to 15 dB
>gain antenna). But, so far, no one has demonstrated such a system.

Your statement is FALSE. Check with N4HY et al about working moonbounce with Oscar class stations and DSP.

>The answer is that more goes on inside the human brain in digging out
>weak signals than most people realized. Maybe, some day, the process
>can be implemented on a few chips, and maybe even improved upon; but it
>hasn't be shown to work that well yet. I won't waste my time and that
>of the Commission discussing further Mr. Kantor's comments. I am happy
>to see that he stopped short of proposing that the Commission "ban"
>Morse code, although he seems to have considered the idea.

So JPL has hundreds of dedicated CW ops straining at their cans copying data from Voyager eh? Get real! Techniques for copying extremely weak signals have been in use for at least two decades. These techniques and newer techniques are now filtering down to the amateur budget.

CW, like restoring antique radios, is a pleasant passtime for some, but claiming that it is ABSOLUTELY UNBEATABLE as a weak signal mode is totally false. Claiming that CW is a cheap way to communicate says that you consider the months of time spent unproductively learning the code had no value. If on the other hand you consider your time to have value, then CW is a very expensive way to communicate. Slow too.

On the one hand we hear CW proponents saying that it will "get through when nothing else will" and on the other hand they scream for protected

sub bands so they won't get wiped out by other modes. Seems kind of
like a contradiction to me.

Oops! Of course 3.58 is in the 80 meter band. What it's not in is the novice
portion of the band 3.70-3.75 (unless that's been moved too!).

I am leaving for the UK in two weeks and would like to locate a PC

based shareware/public domain station logger and/or contest logger
for my laptop. Something like the K1EA (v4.25 or >) would be nice.
Please forward information or uuencoded file to
Katz@sask.usask.ca

Looking for any modifications of the TS-430S, especially

* receiving freq from 100Khz and up,
* better scanning options (e.g. stopping on a station while scanning in FM mode)
* impoving FM selectivity.

TKS, and 73   -   Adi, 4Z4VG

I beg your pardon???   Last I heard, 80 meters was from 3.5 - 4.0 Mhz.
Gee, I hope they didn't move it when I wasn't looking. :-)

Subject: STS-35 SAREX Update and BBS Info

The launch of STS-35 has now been re-scheduled for Tuesday morning,
Sept 18 at 05:28 UTC. The following elements may be used for pre-launch
orbit predictions.

```
STS-35
1 00035U          90261.27986111  .00031000  00000-0  22174-3 0  0030
2 00035  28.4690 270.3379 0005720 246.6067 119.6564 15.71792660    23

Satellite: STS-35
Epoch time:      90261.27986111
Element set:     JSC-003
Inclination:       28.4690 deg          Space Shuttle Flight STS-35
```

```
RA of node:       270.3379 deg          Pre-launch flight profile
Eccentricity:     .0005720                  Keplerian Elements
Arg of perigee:   246.6067 deg        Launch:  18 SEP 90   05:28 UTC
Mean anomaly:     119.6564 deg
Mean motion:   15.71792660 rev/day                 W5RRR
Decay rate:       3.10E-04 rev/day^2      NASA Johnson Space Center
Epoch rev:               2
```

The Public Affairs Office at the Johnson Space Center operates a BBS to provide information to the public. Check this board for updates to the keplerian element sets during the flight. A message will be posted indicatiwhat file contains the new element set. The current element set for the Sep 18, 1990 Launch is found in the file STS35.003 in directory 99.

To access the BBS, call 713-483-2500 using 1200 baud, 8-N-1, at the ENTER NUMBER: prompt, enter "62511" and you will be connected to the BBS.

NASA JSC's Electronic Space Information BBS is intended to provide 24-hour access to biographies of NASA officials and astronauts, news releases, space flight mission presskits and television schedules, space shuttle systems information, flight manifests and schedules, and other information about the space program.

SAREX Timeline (WA4SIR)

Updated 9/4/90 0740 CDT

Times are given in Mission Elapsed Time (MET) which does not change relative to the launch time. You will need to add the MET to the launch time to determine the time these events will occur.

During the times the ROBOT is on packet operations will take place, crew tended periods will normally be voice operations. Primary downlink frequency is 145.550 and primary uplink is on 144.950, secondary uplinks are 144.91 and 144.97. See AMSAT bulletins for more information, in particular ANS-237.01 (8/25/90), ANS-230.01 (8/18/90) or contact W5RRR during the flight on 28.400, 21.350, 14.280, 7.227 or 3.850 for more information.

SB RTTYDX @ ALLBBS $RTDX0914
RTTY DX Notes 1of3 9/14/90

RTTY DX Notes for week ending 14th September 1990
BID: $RTDX0914
Part 1 of 3.

This is the last request for logs of the ANARTS RTTY DX Contest held in June this year. You may be first in your country, even though you have a small score, or you might help to prove that someone else won it. So send your logs to W. Storer, 55 Prince Charles Rd, Frenchs

Forest, Sydney 2086 NSW Australia.

These notes are getting shorter each week, because the propagation is getting poorer despite what the propagation reports are saying. Also some of our reporters have been distracted by other attractions, like holidays. We still hope for better things next week.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT, W2JGR, W6/G0AZT and the Tri-State DX packet cluster network. Thank you all for your information and interest. Please keep it coming.

SB RTTYDX @ ALLBBS $RTDX0916
RTTY DX Notes 3of3 9/14/90

RTTY DX Notes for week ending 14th September 1990
BID: $RTDX0916
Part 3 of 3.

QSL Information:

9J2BO says to QSL via W6ORD.

UJ8JCQ QSL address is Box 1102, 734032 Dushanbe, Tadzhikistan, USSR.

8P9HR will QSL via K4BAI.

S79NBD is JG1NBD when he is at home, so send the cards to his home address.

Notes of Interest:

It seems that I made a slight mistake last week with the QSL management of 1S0XV. It appears that JA3DPB and W4FRU are the managers for the rest of the world, while Russians may send their cards to Box 308, Moscow 103009. So now you have three QSL managers. I think that I have it right this time.

JG1NBD is operating from the Seychelles S79 until 16th September. JH1NQG should be signing KC6CW while JH1BNL should sign KC6DX from 13th September until 16th, after which they will move to Yap from 16th until 19th, where they will sign V63AN and V63AR respectively. QSL to their home calls.

7J1ADJ should also be making a noise from Minami Torishima from now until the 21st. QSL to KB1BE.

JH1QDB will be on Ogasawara (JD1) from 23rd until 30th September.

F2JD will sign CE0ZZZ from Juan Fernandes from mid November, and will be running RTTY with gear supplied by IRDXA.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.
/EX

>
> 73 de WA2ISE

Yup, what you did was to transmit on your crystal frequency, the other guy would transmit on his crystal frequency, and you'd both have to tune around to find who was answering. This normally limited your contacts to +- 10 khz within your transmitter freq.

It was kind of funny. After transmitting rock bound for several months, you got to know the other guys who had similar crystals REAL well. They were the ones you spent most of your time talking to!

I forget what the exact freq bands were... but I spent a lot of time with a 7.??? crystal.

Being rockbound made you really appreciate the General class guys who'd come down and zero beat your transmit frequency so you could talk to them. It gave you someone new to talk to!

I've watched this discussion regarding fixing the "problem" of software being posted to this group with rising amusement. Many people have suggested a number of solutions but no one has yet hit on the most obvious of all - let the people who have a problem with software in this group fix the problem for themselves.

If someone running a mail gateway, say Brian for instance, thinks that his downstream sites would be so offended by or so driven to poverty by the transmission costs of software or other files in this group, then let that person fix the problem. It is trivially easy to screen traffic on the basic of a) size and/or b) content (the leading "M" in uuencoded files is a dead givaway) and/or format (fixed length lines, for example). Using Deliver, that would be a 15 minute task. Then the rest of us who value such postings could continue to benefit from them. Of course, it IS much easier just to bitch about it....

That said, I too would support a group of the form rec.ham-radio.software. Dispense with all the nonsense about a separate group for each computer. Most hams use PCs and for the non-PC software, a simple keyword in the title line will differentiate it from the PC stuff. This group would be an ideal place for Phil's latest TCP/IP stuff as well as all the other ham oriented software. Perhaps Bdale could even be pursuaded to set up an automatic poster daemon for the IP stuff. I say this, of course, because he stated a couple of years ago that it would take too much of his time for him to do so when I asked him to set up an automatic E-mail posting to me so I could redistribute to non- Internet sites.

So here's my suggestion. In the interim, continue posting to rec.ham-radio. And in that interim, let's find someone to volunteer to hold a formal discussion and vote for a software newsgroup for ham radio. Any volunteers?

John

> Language chauvinist! :-)

:-)

> If a program gives results in a reasonable amount of time, and the algorithm
> is properly implemented, who cares what language was used.

The reasons are this:

BASIC is a toy language for toy computers. Don't get me wrong, toys are fun things to have; I have toys; you have toys; he who has the most toys.......:-)

PASCAL was originally intended to be a teaching language, not an implementation language. As a language it is poor for serious development. However groups like Borland (Turbo Pascal) have done a remarkable job of converting a poor language into something useful and powerful. Unfortunately they have done so for only one platform (PC clones, MS-DOS).

C is a systems programming language and fits at a point somewhere between assembly language and other high level languages. It is not the most ideal language to do scientific programming, but it is universally available and there are good compilers for free (GNU GCC for UNIX) or for low cost (Turbo C by Borland and Microsoft C) for PC clones. Rumor has it there is a good C for Macintosh, but I'd not be in a position to verify that.

Fortran is THE scientific programming language, and antenna modeling is just such an application. My tendency in such things as antenna modeling is to be as detailed and discrete as possible in the model. I'm talking simulations that take a few hours to run on an IBM 3081 or Convex C240 mainframe; several thousand segments. This is not a practical option on a PC with BASIC. Not all Fortran compilers are up to snuff, unfortunately.

If all I was going to do was run a small model, never hack the code, and never try to validate the algorithm, a BASIC program for a PC would be fine. But in reality, I will often need to modify the program or verify its algorithm, or even revise it to new technology. Source is required in a language that is easy and practical to maintain. Because I do serious systems programming and development across multiple platforms over a range of computers, the languages I will be proficient in will be assembly (for various machines), Fortran, and of course C. Basic, Pascal, Cobol, Lisp, etc., are not among them.

> If I were an antenna manufacturer, I wouldn't depend on a computer simulation
> to design my antennas. Real range data is much more valuable.

I can twist your words here because I think you made a slight word slip. The design phase definitely needs antenna modeling. The engineer can examine many different ideas quickly this way. But constructiong real antennas and testing them in real life situations is a MUST. Each is a sanity check on the other.

[more kindling on the fire]

How about comp.sources.misc for things in source code, and comp,binaries.? for whatever machine type the binary is for.

The big advantage is that these already exist and are usable now. As far as I know, there is not restriction of the type of programs posted there, and I have seen some variety at times.

I was first licensed as WN7CSK in 1965. In those days, because of crystals, no one on the Novice band calling CQ expected the answer to come back on their frequency. CQs tended to be longer, answering was longer, and the calling station would always "tune the band" looking for a response.

I ran a Heath DX20 into a wire on 80 meters, and the receiver was a
Knight Kit Star Roamer, 4 tube general coverage receiver with NO BFO.
I had one crystal for 3743 KHz (most Novices I found later bought crystals
toward the middle of the band) and I used a knife switch for antenna
changeover from receive to transmit.

No, 3.579545 MHz is not, and was not ever, in the Novice band. The Novice band was from 3.7 to 3.75 MHz. I am not sure, but I think there was a change in this allocation. I think the whole segment shifted down 25 KHz, so it is now 3.675 to 3.725 MHz. I believe this was done in the last year.

That is what it USED to be, when I was a Novice. I think it changed this
year. Here is my evidence:

SB ARRL @ ALLUSA $ARLB010
#10 80m. Reallocation 3/2/90
QST DE W1AW
ARRL Bulletin 10 ARLB010
From ARRL Headquarters
Newington CT March 2, 1990
To All Radio Amateurs

On March 1, The FCC announced that it proposes to change authorized
frequencies for Novice and Technician Class operators in the 80 meter
band. Current authorized frequencies would be changed from 3700 to 3750
KHz to 3675 to 3725 KHz. FCC believes that such relocation would reduce
interference in the 80 meter Novice segment and is asking for comments
from the amateur community.

Copied from W1AW by Tad, KT7H @ N7HFZ.WA.USA.NA.

Nope. You are way off there. ARF is "Amateur Radio Forum" Which is the net run by NR9Q, Thursdays at 10PM EST. I note you support the 2nd ammendment. The net is VERY PRO Gun Ownership, among other topics. It is a current Events discussion net. (Thurs, 10pmEST, 3950khz)

I might like to add that people should decide for themselves if Schmidling is Anti Semitic or not. For one thing, Schmidling himself is Jewish. He is, IMHO NOT anti semitic. He opposes US AID to ISRAEL, which by the way OTHER Americans of Jewish Decent also do. As I understand it, he feels that Jewish Occupation of the West Bank is much akin to the Iran takeover of Kuwait. Actually on the surface, the two events have a certain ring of similarity.

Please do NOT continue this debate HERE in rec.ham.radio. If you MUST post a defamatory message about Schmidling or anyone else, take it to a more apropriate newsgroup. I am posting this reply ONLY to correct the error that ARF and BARF are related. I can ASSURE YOU there is ABSOLUTELY NO CONNECTION between the two groups. I also take offense at your characterization of NR9Q, and encourage those interested to judge for themselves by reading his postings OR better yet checking into his net this coming thursday. It could surprise you.

Please NO MORE OF THIS DISCUSSION IN THIS GROUP!

It has finally happened. SOMEONE finally got fined for the 20 meter mess. Not the chicken squawker, Not one of the ten thousand tape players on the frequency, or the people that swear like longshoremen. Those people DON'T ID.

The fines went to key members of the Better Amateur Radio Federation (BARF).

Herb Schoenbaum, KV4FZ.... Dick Eastman, N5FX, and one other lesser player all got $1,000 fines for "causing interference" to other stations. Actually, they received "Notice of Apparent Liability", which is NOT EXACTLY a fine.

The fines do not seem to have quieted Schoenbaum, who is as verbal as ever. Eastman, a blind ham living on social security, is a bit more subdued of late. FZ was in Florida this past week. Rumor has it he is going to try and fight the fine, since HE claims he was fined for ANSWERING a call on frequency at the time he allegedly was supposed to be causing the interference.

It would seem that the FCC has targeted the BARF BOYS. Certainly if they were somehow no longer on the air, a great deal of this controvercy would vanish quickly. These operators are like the bellows in a foundry, keeping the flames high by pumping in a lot of wind.

However, one has to admit that much of what the BARF boys say happens to be dead square on the money. Perhaps it is just the WAY they say it, and the fact that they say it and say it and say it and say it that causes the problem.

I don't think it is over yet.

Stay tuned to either 14.313 or 14.300 depending on who got where first when.

>discussion and vote for a software newsgroup for ham radio. Any
>volunteers?

Let's not.
Instead, let's use the groups that already exist for such things: the comp.* groups. For example, the recent Super Morse posting should have gone to comp.binaries.ibm.pc, for two reasons: 1) it's where binaries for the IBM PC belong, and if your site doesn't get c.b.i.p, then you shouldn't try to end-run binaries around the restriction; and 2) it may well have gotten wider

exposure that way, thus giving people who don't read rec.ham-radio a chance to play with a Morse Code program, thus possibly breaking down one of the excuses for not getting into ham radio. (Oops. Not politically correct. Ignore that last.)

A proposal for rec.radio.software will be met with exactly this objection from the admins of the net. For such a group to pass, it will need an answer to that objection.

Nothing mysterious about it. You used 1/4 inch mesh wire screen. It was sort of like HEAVY duty chicken wire fencing, only maybe 14 guage wire (and square holes). You could cut it to shape, fold it, bend it, solder leads going to ground to it, run wires going elsewhere through it. Neat! If you needed a tube socket hole, you snipped a few wires and poof! a hole. It was strong enough to mount almost all kinds of hardware on - even small transformers. When you got the thing working right, you rebuilt it permanently using conventional materials. (Then, of course, it no longer worked!)

Not me, but I'm terrible with names. I often wondered if they were guys in the ARRL Lab. "Hey, dude, gimmee two inches of Hints and Kinks for Page 56."

WHAAAT???!!??? 3.58 MHz not in ANY HAM BAND? It is not in any NOVICE
SUBBAND, but it certainly is in the amateur 80 meter allocation, which
is from 3.5 to 4 MHz.

Anyone know if Genie Information Systems (the nation-wide computer dial-up system similar to compuserve) has any support areas for amatuer radio?

Also is there any E-mail gateway access to any of the E-mail systems. I am told that Compuserve does have some sort of gateway.

This inquiry was prompted by Genie's decision to offer flat-rate connect time starting 10-1-90. Similar to Prodigy, but only $4.95 monthly non-prime without the trashy graphics, trash software, and slllllllooooooowwwwww response. This flat-rate doesn't apply to all of Genie's offerings, but to many including their E-mail system.

Would appreciate any responses (even the ever-present flaming barbs) especially from any current subscribers of Genie who will soon have to make the decision to join the flat-rate crowd or drop the service.

I live in Iowa City and I'm looking for swaps to attend. Can anyone tell me of any in Iowa City or in Cedar Rapids? Heck, I'd even drive to Des Moines or the Quad Cities if I can't find anything nearer home.

Thanks!

Michael

SB ALL @ AMSAT $ANS-258.01
PRELIMINARY KEPS FOR STS-35

HR AMSAT NEWS SERVICE BULLETIN 258.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Preliminary Orbital Elements For STS-35/SAREX Mission For Sept. 18 Launch. The Johnson Space Flight Center (JSC) Amateur Radio Club, W5RRR, has released the following preliminary Keplerian element set for the Space Shuttle Flight of STS-35. This element set ASSUMES that the Shuttle Columbia will lift-off as soon as the launch window opens September 18, 1990 at 05:28:00 UTC.

```
Satellite: STS-35
Catalog number: TBD
Epoch time:      90261.27986111           (18-SEP-90 06:43:00.000 UTC)
Element set:     JSC-003
Inclination:       28.4690 deg             Space Shuttle Flight STS-35
RA of node:       270.3379 deg               Pre-launch flight profile
Eccentricity:    0.0005720                      Keplerian Elements
Arg of perigee:   246.6067 deg           Launch: 18-SEP-90   05:28:00 UTC
Mean anomaly:     119.6564 deg
Mean motion:   15.71792660 rev/day                       W5RRR
Decay rate:       3.10e-04 rev/day^2          NASA Johnson Space Center
Epoch rev:               2
```

In the NASA "2-line" format the above STS-35 elements are as follows:

```
STS-35
1 00035U          90261.27986111  .00031000  00000-0  22174-3 0  0030
2 00035  28.4690 270.3379 0005720 246.6067 119.6564 15.71792660    23
```

All stations wishing to obtain updated STS-35 element sets should monitor the NASA affiliated radio clubs: WA3NAN, W5RRR, and W6VIO. Also, W1AW will provide up-to-the-minute information with its CW and phone bulletins on published frequencies in QST.

NASA Affiliated Radio Clubs & W1AW To Provide STS-35/SAREX Mission Updates

Radio amateurs and Short Wave Listeners (SWL) will have many opportunities to listen to all the onboard activities from the Shuttle Columbia as the astronauts perform their planned scientific experiments and investigations with the ASTRO-1 payload. The following list of frequencies will provide a "spot" to listen and receive pertinent information on the progress of STS-35 and the Shuttle Amateur Radio Experiment (SAREX). Live shuttle audio will only be rebroadcast when the astronauts are awake. W1AW will provide SAREX Mission updates during its daily bulletin schedule.

BAND	WA3NAN GSFC	W5RRR JSC	W6VIO* JPL	W1AW VOICE BULLETINS**	K6MF***	WA4NZD MSFC
75	3.860	3.850	N/A	3.990	3.840	3.855
40	7.185	7.227	N/A	7.290	7.165	7.232
20	14.295	14.280	14.270	14.290	N/A	14.267
15	21.395	21.350	21.340	21.390	N/A	21.362
10	28.650	28.495	N/A	28.590	N/A	28.395
2	147.450	146.640	145.460	N/A	145.580	N/A
1.3	N/A	N/A	224.040, 224.080	N/A	N/A	N/A

*W6VIO will provide live shuttle audio coverage to the South Pacific and Japan by pointing its HF beams in that direction.

**W1AW Voice Bulletins are transmitted daily at 01:30 UTC and 04:30 UTC. W1AW will also provide rebroadcast of shuttle audio on Voice Bulletin frequencies when WA4SIR is communicating with school children. These "live" sessions with school children are scheduled throughout the STS-35 mission.

***K6MF will provide live shuttle audio coverage for the San Francisco Bay Area.

SB ALL @ AMSAT $ANS-258.03
SAREX OPERATION PROCEDURE 1

HR AMSAT NEWS SERVICE BULLETIN 258.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Understanding the Basics Will Make SAREX a Success (Part 1)

The Shuttle Amateur Radio EXperiment, also known as SAREX, has sparked interest in space communication in a large number of amateur stations around the world.

For a good number of stations, this may be their first attempt at talking to other than "earth-bound" stations. By understanding the basics of when it is possible to communicate with Ron Parise, WA4SIR, it will make it a more successful experience for all involved.

First it must be understood that the orbiter Columbia is in low earth orbit. It will be at an altitude of about 150 miles traveling at about 17,500 mph. Being in low earth orbit it will move across the sky very quickly and is not like a geostationary satellite which appears to be fixed at one location in the sky at all times. This means that at best, you will have no more than about 10 minutes maximum during which Columbia will be visible from your QTH during any particular orbit.

Because all communications with SAREX will be done in the 2 Meter band, once Columbia "drops" below the horizon, it will not be possible to communicate with Ron or the packet ROBOT on-board the Orbiter (propagation at 145 MHz does not bend with the ionosphere like it does on HF). Attempting to call Ron when Columbia is not visible from your QTH is pointless and can in fact be disruptive to other amateur communications. Your transmitting frequency of 144.95 MHz is also used in some areas by amateur packet systems. To minimize the disruption to other stations, it is necessary to derive a schedule of when Columbia will be above the horizon and to verify that transmissions from Columbia are in progress on 145.55 before attempting to transmit. Part II of this bulletin will provide some examples of this schedule, and give you information on how to derive one for your QTH.
/EX
SB ALL @ AMSAT $ANS-258.04
SAREX OPERATION PROCEDURE 2

HR AMSAT NEWS SERVICE BULLETIN 258.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Understanding the Basics Will Make SAREX a Success (Part 2)

Using any of the popular satellite tracking programs, loaded with the Keplerian elements for Columbia's orbit, you will be able to print out a listing of times when Columbia will be visible from you QTH. If you do not have access to one of these programs yourself, contact AMSAT Headquarters at (301) 589-6062 and you will be given the name and phone number of an AMSAT volunteer near you. They will be very happy to work out the schedule for you.

Below are listed the UTC date and AOS/LOS times (Acquisition of Signal/Loss of Signal) for Atlanta, Dallas, and Los Angeles. These schedules are based on a Sept 18, 5:28 GMT launch of Columbia. You will note that most of the passes last no longer than 10 minutes and they are late at night.

QTH	DATE	AOS	LOS	ORBIT #
ATLANTA	20SEP90	0306	0315	31
"	20SEP90	0442	0452	32
"	20SEP90	0619	0628	33
"	20SEP90	0757	0803	34
DALLAS	20SEP90	0303	0311	31
"	20SEP90	0439	0448	32
"	20SEP90	0615	0625	33
"	20SEP90	0752	0801	34
LOS ANGELES	20SEP90	0435	0443	32
"	20SEP90	0610	0620	33

"	20SEP90	0747	0756	34
"	20SEP90	0924	0932	35

Based on your location, you should only transmit to SAREX when it is above the horizon and should not leave your equipment unattended attempting to connect automatically. This is very unlikely to meet with success but is certain to generate unnecessary QRM. You should listen first on 145.55 to determine if you can hear WA4SIR. Only when you can hear his transmissions should you consider calling him or trying to connect to the packet ROBOT. Do not transmit on the 145.55 downlink frequency. WA4SIR will not be listening there.

This mission has the potential to provide Amateur Radio with some Prime Time "PR". Many non-hams as well as the news media will be watching our "performance". A negative experience during this mission could very easily jeopardize any future SAREX missions. By properly preparing prior to attempting a QSO with SAREX, not only will you give yourself a better chance to actually succeed at talking with Ron, but it will show the world at large how exciting Amateur Radio can be. Good Luck!!

Downlink/Uplink Frequencies for Voice QSOs to be used on Upcoming Mission

Just in case you missed it (perhaps you have been on vacation for the past 4 months) here are the SAREX frequencies:

	Shuttle TX Freq	Shuttle RX Freq	
North/South	145.55 MHz	144.95 MHz	*** Primary ***
American	"	144.91 MHz	
Frequencies	"	144.97 MHz	
Remainder	145.55 MHz	144.95 MHz	*** Primary ***
of the World	"	144.70 MHz	
Frequencies	"	144.75 MHz	
	"	144.80 MHz	
	"	144.85 MHz	

These are the frequencies Ron Parise (WA4SIR) will use on both voice and packet. Please note that the frequencies Ron will be listening for stations ARE DIFFERENT than the one he will transmit on. This is a very important fact to understand. Ron will transmit to earth (downlink) on a single frequency: 145.55 MHz. He will listen for stations transmitting to him (uplink) on the other frequencies listed. This "split" operation is used quite successfully by DXers when operating in an environment where large pile ups are expected.

The first pair of frequencies (noted as primary) is a standard -600 KHz split used by repeaters. This was done so that communicating with SAREX could be accomplished by Hams using standard FM transceivers. If Ron finds that the receive QRM becomes unmanageable, he may listen on the alternate frequencies listed. In North America, the lower section of the FM repeater bandplan extends as high as 144.90 and thus why the uplink frequencies only extend down to 144.91 MHz.

THIS IS IMPORTANT! There will be no simplex operation with SAREX on either voice or packet. Although packeteers are not used to operation with a TX/RX offset, in this case, it is the only way to connect to SAREX. If you transmit on 145.55 MHz the only people who will hear you are those other Hams in your area trying to contact SAREX (You will most likely become an instant celebrity, but not necessarily in the positive sense of the word!).

There should be about 3 KHz of Doppler shift due to the orbital velocity of the Columbia spacecraft (it will be about 3 KHz high near the beginning of a pass and about 3 KHz low near the end). By limiting the deviation of your transmitter to 3 KHz, Ron's receiver should have little trouble capturing your signal.

TRACKING SOFTWARE PIRATED

HR AMSAT NEWS SERVICE BULLETIN 258.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Pirated Versions of AMSAT Software are Appearing on BBSs

A number of BBS sysops have called into AMSAT Headquarters inquiring as to whether Instant Track was now being offered as shareware or is in the public domain. It seems that there are people who are uploading the software into BBSs from which anyone who dials in can download a "free" copy. In many cases the copyright information is still intact when running the program.

NONE of the tracking software which AMSAT offers is in fact shareware or in the public domain. The distribution of software is one of the major contributors to the funding of the construction, launch and operation of AMSAT's satellites.

These pirated versions of the software represent a serious threat to future spacecraft development. If any of you see any software which is being distributed by BBSs that does not look like freeware, please inform the SYSOP immediately. With many thousands of files on most BBS systems, it is not unusual for SYSOPS not to look at all of them.

DRIG WX SATELLITE UPDATE

HR AMSAT NEWS SERVICE BULLETIN 258.07 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990

TO ALL RADIO AMATEURS BT

DRIG Provides WX Satellite Frequency Summary

Jeff Wallach (N5ITU), Chairman of the Dallas Remote Imaging Group (DRIG) wants to remind OSCAR satellite users they can easily process weather satellite Automatic Picture Transmissions (APT) using a large part of their current station. If you have a 2m beam or a turnstile with a pre-amp, if you have satellite tracking software and a general coverage receiver which can tune to a 137 MHz, you are not far from being able to process WX pictures. Ideally the 137 MHz receiver you use should be capable of wideband FM modulation with a 50 KHz wide IF, but N5ITU had experimented with FM scanners which have 150 KHz IF with good success! Jeff points out that there are several interface cards which can easily be installed into IBM PC computers and clones which will turn the APT signals into very detailed pictures (4 km of resolution). Once you have the weather image signal and its audio is routed to the interface card in the back of your PC, with the proper software, the pictures are easily produced on a EGA or VGA screen. For further information about what it takes to process APT pictures, please read Bulletin #17 on the AMSAT/DRIG BBS at (214) 394-7438.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 258.08 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Backup	U.S. day

```
28 Sep 90  171  J/L  0100  KA5SMA   N5BF   Thursday
 9 Oct 90  172  J/L  0015  WD0E    WB9ANQ  Monday
```

An AO-13 re-orientation is scheduled for 15 October 90. The new Operations Net schedule will be distributed starting next week.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-258.09
AO-13 / AO-10 TRNSPNDR SKED

HR AMSAT NEWS SERVICE BULLETIN 258.09 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8 which is planned to continue through October 17.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods. Satellite reorientation (a.k.a. magnetorquing) is scheduled to commence on October 15 and once it has been completed, it is expected that Mode S will be returned to service.

The present transponder schedule for AO-13 is as follows:

```
Mode-B          : MA 003 to MA 165
Mode-JL         : MA 165 to MA 195
Mode-B          : MA 195 to MA 240
Off             : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas   : MA 240 to MA 060
```

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals started showing signs of FMing. Therefore, until further notice please DO NOT use AO-10's transponder.
It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

mikey@pnet01.cts.com (Mike Shirley) writes:
>Anyone know if Genie Information Systems (the nation-wide computer dial-up
>system similar to compuserve) has any support areas for amatuer radio?

Yes -- a full Radio/TV RoundTable. Pretty reasonable, too.

>Would appreciate any responses (even the ever-present flaming barbs)
>especially from any current subscribers of Genie who will soon have to make
>the decision to join the flat-rate crowd or drop the service.

Me? I'm slowly disconnecting from USENET and connecting with GEnie. Costs me a bit more, but definitely worth it. Turns out that (1) having to pay a little money, and (2) having sysops that slap idiots hands once in a while cuts way down on the noise, stupidity and flaming that USENET is famous for.

"Wrong sideband?" Say what? It's possible to tune any AM signal in SSB mode on either sideband. I do it all the time on the SW bands.

This raises a side of electronics that has been a quiet revolution. It is also something that has made it as cheap to make stuff in Switzerland as Malaya. I am going to try to be brief here so forgive me if I miss anything.

Back in the 60s when most of my generation were taking drugs and telling me they had learned how to "communicate" I was learning that "electronics" was one of the most labour intensive industries. These were the days when PC boards were coming in, but many companies like Tektronics were still making stuff with glowfets and point to point wiring. Building radios and stuff was a semi-skilled activity. It took a large amount of time to build and align a Collins S line or Racal RA-117 radio. This is what had to be paid for. Labour was a major part of the cost of an electronic device. In these days, Heath was a deal because the i supplied the labour and called it pleasure.

Then PC boards and ICs came in and the labour to function ratio went to hell. To reduce labour further, automatic assembly and test equipment came into being. So these days instead of rooms full of women with smoking soldering irons we have halls filled with automatic machinery stuffing multilayer boards, soldering them and testing them. Whackity-whak and out comes an XT board that retails for $80.00. A receiver in a chip costs $3.50.

The last product that I ever worked on getting to market was an answering machine with combined phone and dialer. The device had 45 mins of human labour time total and that includes packing it into the box and driving the forklift to the dock. So if we assume that the same answering machine were offered by Heath, this is an idea of the cost savings: Labour at Heath to pack and ship 15 Mins. Labour at Phone factory to make, pack and ship 45 mins. Heath savings: 30 Mins. Labour cost (padded) $7.50 per hour. Savings: $3.75 . Considering that such a device would retail at K Mart for probably $115.00. It is hardly worth to saving $3.75 to spend hours building by hand what a machine can whack together with greater precision in only a few minutes.

That should explain why Heath is not such a deal these days. The break they gave you was on the manufacturing labour costs and those costs have gone away. Also to be considered, but not part of this is the impact of Surface Mounted Devices on manufacturing and repair.

You can post programs to my "community ftp" disk space. Everione has WRITE access, though only one at a time can get write access. So don't go erasing someone else's files unless they are the oldest and there is not space left. There is no security, so treat it as such.

To use it:

```
ftp vmd.cso.uiuc.edu
user anonymous
cd phil.512
binary
  .
  .
  .
quit
```

Remember you must use binary on all non-text files. The system is an EBCDIC system and text files will be translated to EBCDIC, so for text files that were uploaded non-binary they must be downloaded non-binary so that they will be translated back to ASCII.

If you are uploading a package of files, please collect them into a single file and compress it. For UNIX stuff, please use tar format. For PC stuff please use arc, zip, or joo. For Mac, I don't know what is available. Maybe someone from ap`le.com, and a Mac-pert, can followup here and say.

An easy way to make a code-practice oscillator is to remove the earphone and carbon mike from a standard Western Electric telephone handset, wire them in series, and place them face-to-face. They form an audio-feedback oscillator which makes a very pure tone. Its frequency depends on voltage and polarity; a 9v battery works well as the power source. It may be necessary to remove the varistor or capacitor that is across the earphone's terminals.

If you make a Long Distance CPO using mike-earphone buzzers, then you can separate the elements and it becomes a telephone. (Don't tell the students that until after they learn the code. :-) Alternatively, it's an easy way to make a ringer for home-brew phones.

REPLY COMMENTS OF PHILIP R. KARN, JR., KA9Q
.ps 10
.\".ls 2
.sp 2
.ce 1
\fBSummary\fP
.LP
In mid June and again in early August, I spent four days personally
reviewing the entire public file in PR Docket 90-55 at the Commission's
public reading room in Washington DC. The comment period closed a week
before my last visit, so I was able to review every comment that had
arrived by the August 6 deadline. I copied many of the comments and
have studied them in the weeks since. I offer these reply comments for
the Commission's consideration.
.LP
Those against the codeless license base their
position on a very small set of arguments. In my opinion, all of these
arguments are based on emotion and the protection of parochial
interests, not logic or the wider public interest. Opponents of the
codeless license refuse to recognize the rapid, dramatic advances that
characterize communications technology, and they refuse to accept that
amateur radio must continue to earn its spectrum by living in the
present, not the distant past.
.LP
Many make various assertions
about the superiority of the code as an operating mode. Even if these
assertions were all valid, none would not be relevant as arguments
against a codeless license. But many of the assertions are simply
\fIwrong\fP, and they reveal widespread ignorance of more modern forms
of communication.
.LP
The ARRL claims that the amateur community supports a codeless license
```

```
only if it is restricted to frequencies above 220 MHz. But the actual
comments in the file belie this claim. A clear, though not
overwhelming, majority of comments favors a codeless license. However,
most of those in favor clearly support giving Communicators access to
all frequencies above 30 MHz, while those who oppose a codeless license
would seem to oppose it under all circumstances.
.LP
The Commission's constituency, the general public, is
much broader than that of the ARRL, as licensed amateurs make up only about
0.2% of the US population. So the Commission should not give undue weight to
those parts of the ARRL's comments (especially their proposal to restrict
Communicators to 220 MHz and up) that are based more on short-term
political compromises rather than the long term interests of the
Amateur Service and the general public. I therefore urge the Commission
to disregard the comments in opposition, to create the Communicator
license, and to give it full amateur privileges above 30 MHz.
.bp
.LP
.ce 1
\fBDiscussion\fP
.LP
Due to the size of the file, it is impractical to reply to each and
every set of comments that have been filed in opposition to the
creation of a codeless license.  However, several common themes occur
very frequently.  In these reply comments, I have selected a few that
are representative of each argument, following each with my response.
.LP
.ce 1
\fB"Removing the code requirement would turn amateur radio into CB!"\fP
.LP
This is by far the most popular remark by die-hard opponents of a
codeless license. Here is a tiny sampling:
.QP
"The blabbers want to make Amateur Radio a race track for CBers."
(Red Barger, W3CVE, page 3.)
.QP
"The whole reason for my pursuit of the amateur radio class was
to escape the garbage which threves [sic] on the Citizens Band radio.
Do you people realize what will become of the amateur frequencies if
this no-code proposal reaches it's full potential? The same conditions
will exist on HAM bands." (Mitch Mashburn)
.QP
"The code requirement at this time is keeping the rif-raf off of
the ham bands. (Jim Jackson)
.LP
This argument, despite its popularity, is deeply flawed for several
reasons.
.LP
First, even without a code test, applicants for the Communicator would
still be required to pass a written examination equivalent to or more
comprehensive than that passed by Technician class licensees. This
hardly renders the Communicator license equivalent to CB, for which no
license at all is required.
```

```
.LP
Second, codeless licenses exist and have been successful in many other
countries. Nowhere (with the possible exception of Japan, whose
extremely high population density and very simple written test makes it
a special case) has the result been anything like a "CB fiasco".
Indeed, I personally know several foreign amateurs who hold codeless
licenses that have made significant contributions to amateur radio
(more about these later.)
.LP
Third, the Citizens Radio Service is only one of many other services
that do not require their operators and users to know Morse Code.
Others include broadcasting, public and private land mobile (including
police, fire, GMRS and business band radio), common carrier (e.g.,
cellular telephony), and aviation. All seem to get along just fine
without a code requirement for their operators. Why single out CB for
comparison?
.LP
Yes, I have actually listened to operations on the Citizens' Band. I
concede that most AM operations there are hardly well disciplined.
However, it's a different story in the SSB segment and the illegal
"free band" above Channel 40. In general, the operators there sound
like reasonably courteous people. They talk about the same things that
radio amateurs talk about, and they even use amateur radio lingo and
operating procedure. Except for a) an apparent inability to standardize
on a given sideband, and b) a lack of call signs, I would have been
hard pressed to tell this segment apart from a legitimate amateur band!
.LP
Could it be that some amateurs oppose the codeless license so
emotionally because, deep inside, they see little difference between
themselves and the CB operators they despise save proficiency in Morse
Code? Certain spots in the amateur bands, such as 14.313MHz, sound
very much like the AM portions of the CB band. Indeed, on my second
visit to the Commission I saw copies of citations that had just been
issued to two operators involved in "net wars" near that frequency, and
both held Extra Class licenses. So much for code proficiency as a
filter to the undisciplined!
.LP
It would seem that merely the ability to tune a SSB radio is sufficient
to filter out most of the undisciplined operators, yet not even a 20 wpm
code test will filter them all out.
.LP
.ce 1
\fB"I learned Morse Code so should everybody else"\fP
.LP
This is another popular comment. For example:
.QP
"I feel appalled that after all my hard work to achieve a small
portion of the HAM frequencys [sic] and many more to those who
have not worked or endured the qualifications to become an
amateur radio operator." (Mitch Mashburn)
.QP
"I worked extremely hard to earn my license and feel that everyone
else should do the same." (Virginia Watson, KA5KBP)
```

```
.LP
These arguments oppose change simply because it \fIis\fP change. The
opposition is purely emotional, and as such it really doesn't deserve
a response. All I can say is that the same attitude is
responsible for many lingering problems in our society, including
fraternity hazing and racial discrimination. I hope the Commission will
base its decision on reason, not emotion.
.LP
.ce 1
\fB"Code is an amateur radio tradition, a part of our heritage"\fP
.LP
.QP
"The code is a tradition of amateur radio ... and should be continued."
(Edward Switzer, WB8TCT)
.LP
There are many flip answers to this argument.  I will even admit to
making a few: "So is spark.  So are electrolytic rectifiers, crystal
sets and superregenerative receivers." And so on.
.LP
I should make it clear
that I have no objection to anyone carrying on the tradition
of Morse Code should he or she so desire. What I \fIdo\fP object to
is the notion that \fIevery\fP amateur should be \fIforced\fP to do so.
.LP
The English author Gilbert Keith Chesterton (1874-1936) had this to say
about tradition:
.QP
Tradition means giving votes to the most obscure of all classes, our
ancestors. It is the democracy of the dead. Tradition refuses to
submit to the small and arrogant oligarchy of those who merely happen
to be walking.
.LP
But such remarks don't really give proper justice to the issue because
traditions deal with such deeply held personal values and philosophies.
It deserves a serious answer on the same level.
.LP
The big problem with the "code is tradition" argument is that it
obscures the \fItrue\fP tradition and heritage of amateur radio, which is
of a completely different nature.
.LP
Let's look at the first section of the FCC rules: Part 97.1, Basis and
Purpose.  Five short paragraphs list all the ways we're supposed to
justify our existence as a service (i.e., retention of our frequencies).
In summary, these are: serving the public (especially in emergencies),
advancing the radio art, training individuals in communication,
technical and engineering skills, and enhancing international goodwill.
.LP
This section first appeared in the rules as Part 12.0 in 1949.  In 1951,
the "international goodwill" paragraph was added and the other parts
were amended slightly.  The section has remained unchanged ever since.
.LP
Note that the authors of these paragraphs wisely omitted any reference
to a specific technology or mode of communication.  The point is that
```

these goals transcend technology. Our goals, not Morse Code or any other mode, are amateur radio's \fItrue\fP traditions!

.LP

One measure of how fundamental these principles are can be seen in the fact that this was virtually the only section to emerge from the recent FCC rewrite proposal completely unchanged. In fact, the FCC used them as an outline for the remainder of their proposed new rules; they are likely to carry us through the end of the century.

.LP

Think back to 1949, if you were around then. Captured German scientists in the US and USSR were busily working on rockets, but Sputnik was still eight years away. Who could have known that by 1990, 41 years later, amateurs would have successfully built and launched several dozen of their own satellites, both for experimentation and for routine world wide communications?

.LP

In 1949 the first true electronic digital computer, the vacuum-tube "ENIAC", was still state-of-the-art. It occupied two large rooms: one for the computer hardware, and a second for the air conditioning. Who then could have known that by 1990, something like half of all US hams would own their own "personal" computers -- machines many thousands of times more powerful than ENIAC, yet small enough to fit on a desktop or even carry in a briefcase? Who in 1949 could have predicted that by 1990, hams would be using computer technology on a large scale to build fully automatic traffic handling networks? (The very first packet-switched network, the ARPANET, was still 2 decades in the future.)

.LP

Yet these newer activities are just as much in the spirit of the Basis and Purpose of the Amateur Service as was the spark traffic handling that originally gave the American Radio Relay League its name. Our technologies may change, but our goals remain the same. In fact, continuous technological progress is a cornerstone of our heritage; the rules challenge us "to contribute to the advancement of the radio art" and to "advance skills in both the communication and technical phases of the art". The technology and skills that permitted us to meet our purposes in 1949 is no longer sufficient today. If we do not adapt to the times by developing and learning new and better methods of communication and de-emphasizing those that have become less relevant, we will be left behind in the ever-increasing competition for spectrum.

.LP

In the early years of amateur radio, Morse Code was all there was. To do anything useful in the service at all, you had to know it; a code requirement then made perfect sense. But the development of new modes of communication such as VHF FM, packet radio and satellites has made it possible for many amateurs to fulfill our Basis and Purpose without using Morse Code at all. So why do we continue to require it of every amateur? The code requirement has become an anachronism. Far from maintaining our "amateur radio traditions", it has diverted us further and further away from them. It is time we brought the original spirit of amateur radio back into today's world by creating a codeless license.

.LP

.ce 1

\fB"It's easy to learn the code"\fP

```
.LP
Ironically enough, this argument is popular with many of the same people
who also maintain that the code requirement serves as a necessary test
of discipline and motivation for obtaining an amateur license. For
example:
.QP
"The code test is a key factor in maintaining high quality
responsible operators in the Amateur ranks. Removal of the
code requirements would result in greater numbers of Amateurs
but with less respect for the privileges they have been granted
...
I've given dozen's of tests ... they had little difficulty
with the code test..." (Allan Hardigree, WA4AON)
.LP
In other words, we need the code test because, at the same time, it
both takes a lot of hard work and is very easy.
.LP
Even ignoring the obvious contradiction, this argument misses the point
in several ways. Even if I accept Mr. Hardigree's and other
instructors' assertions about how easily their students pass the code
test, they say nothing about how many potential students don't even
bother to sign up because of the existence of the code requirement.
Since attendance at a licensing class is voluntary, those who do attend
are a self-selected sample and are thus not representative of the
general population.
.LP
Furthermore, even if the code were not a significant barrier to
otherwise qualified persons (a proposition with which I strongly
disagree), this would not argue against a codeless license. The real
issue is whether the code requirement is \fIrelevant\fP, not whether it
is hard. The record clearly shows that it is \fInot\fP relevant to
present-day VHF/UHF amateur operations and therefore should be
abolished regardless of perceptions of its difficulty.
.LP
.ce 1
\fB"Why not get rid of the written exam too?"\fP
.LP
.QP
"Here are some ideas whose time has clearly come...
The no-code license...
The no-theory license...
The 'no-English' education..." (Anonymous)
.QP
"Using much the same arguments as the proponents of a no-code
license have been using, a computer science graduate student
recently asked me why there should be a technical exam as
a license requirement. He claimed that he did not intend to
build or work on radios, but he just wanted to be able to
use a hand held transceiver to talk to people."
(Alan Larson, WA6AZP)
.LP
The first quote is typical of the sarcasm often contained in this
argument. The second quote, however, was made seriously, and deserves a
```

```
reply in kind.
.LP
The reason there should continue to be a technical written exam for an
amateur radio license (even though there should no longer be a code exam)
is easily seen in the Commission's own definition of the Amateur Service:
.QP
"A radiocommunication service for the purpose of self-training,
intercommunication and technical investigations carried out by
amateurs, that is, duly authorized persons interested in radio
technique solely with a personal aim and without pecuniary
interest." (47 CFR 97.3(a)(4))
.LP
It is certainly true that one does not need much technical
knowledge merely to operate a hand-held radio; thousands of
non-amateurs prove this every day. But merely operating a transceiver
doesn't necessarily further the Basis and Purpose of the Amateur
Service. Section 97.1 stresses the technical aspects of the service in
the context of self-training and advancing the radio art. These
activities require much more than just the knowledge of how to use a
radio, but they certainly do \fInot\fP require a knowledge of Morse
Code. And \fIthat\fP is the crucial difference between the code and
theory tests.
.LP
.ce 1
\fB"The Code Requirement is Not Keeping Out Technical People"\fP
.LP
One commenter, Robert Carpenter W3OTC, presents some curious
statistics to argue that the code requirement is not keeping out highly
technical people. He surveyed the author lists in US amateur technical
publications such as ARRL's QEX, the AMSAT Journal, and the Central
States VHF Society proceedings. He goes on to say
.QP
"100% of the amateurs mentioned in amateur satellite design,
construction, and operation held high-code-speed licenses....
ALMOST ALL OF THE PEOPLE IN HIGHLY-TECHNICAL ASPECTS OF AMATEUR
RADIO HOLD 13- or 20-WPM LICENSES." (page 3. Emphasis original)
.LP
This argument is a good example of statistics abuse. Carpenter's
analysis confuses causation with correlation.\** And it says nothing about how
many \fImore\fP authors of technically oriented articles
there could have been had there been a codeless license.
.FS
In my profession, computer science, we call this error
the "refrigerator light
effect". This comes from the joke about the person who insists that the
light in his refrigerator is always on because it has been on every time
he opened the door and looked inside.
.FE
Furthermore, I would not read too much into Carpenter's assertion that
technically oriented US amateurs usually hold licensees with code speeds
above 5 wpm. From personal experience, I can say that the
step between zero wpm (i.e., no code proficiency) and 5 wpm was a \fImuch\fP
bigger hurdle than the step between 5 wpm and 13 or even 20 wpm.  Once I had
```

```
learned the code, it was relatively easy for me to increase my speed, but
that first step was a killer.
.LP
Carpenter cites only the current license class of each
author in his study. He had no way of knowing the code proficiency required
by the initial license class of each individual. So he could have made an
equally invalid case that the Novice Class does not serve the interests of
technical development because so few technical authors hold Novice class
licenses. Yet many of those same authors, including myself, got their starts
through the Novice Class and later upgraded. How many would probably
never have been
licensed at all if it weren't for the Novice? I assert that the answer is
"many", including myself. And how many \fImore\fP technically oriented
people have been kept out all along by even the 5 wpm Novice/Tech code
requirement? I believe the number is even larger.
.LP
Some essential controls are notably lacking from Carpenter's study. In
particular, he cleverly excludes non-US amateurs and publications from
his figures, thus avoiding comparisons with countries that do have
codeless licenses.  My own work on amateur satellites and packet radio
has introduced me to many highly productive, technically oriented
amateurs who hold (or held) codeless licenses in these other
countries. More than anything else, these contacts have convinced
me of the urgent need for a US codeless license.  Here are just a few:
.IP
Peter Guelzow, DB2OS (West Germany). Peter is the primary ground
command station operator for the AMSAT-Oscar-13 satellite. As
such he leads a team responsible for ensuring the overall health of
the spacecraft and for changing operational schedules as
conditions require.
.IP
Matyaz Vitmar, YT3MV (Yugoslavia). While in the United States on a Fulbright
scholarship, Matyaz volunteered his talents and spare time to AMSAT. He
designed and built the transmitters on the AMSAT \fIMicrosat\fP satellites
launched in January. These transmitters achieved the highest efficiencies
yet for any AMSAT satellite; indeed they represent a significant advancement
of the state of the art.  Before coming to the US, Matyaz published
articles in the German-language amateur publication \fIVHF Communications\fP
on his amateur digital signal processing efforts, having built
a DSP system with the Motorola 68000 microprocessor.
Matyaz's current license requires code
proficiency, but he started with a no-code license.\**
.FS
Following Carpenter's reasoning, had this person been an American publishing
in US journals he would
have been included in the "technical authors that hold code licenses"
category even though much of his work was done under a codeless license from
which he has since upgraded.
.FE
.IP
Rob Janssen, PE1CHL (Netherlands). Rob is a major contributor
to my TCP/IP packet networking software project. He made the
suggestion that formed the base of my current "NOS" version of
```

```
the software, and he has developed a version of the system for
the Atari ST computer that is popular with European radio amateurs.
.LP
If Mr. Carpenter had included the proceedings of the ARRL Computer
Networking Conferences in his study, he would have noticed authors with
callsigns such as IW1PTR and several Japanese callsigns which all appear to
be foreign codeless licensees according to the International edition of the
Radio Amateur Callbook.
.LP
A quick look at a few foreign amateur publications might be in order.
The West German \fIUHF-Compendium\fP, a two-volume collection of technical
construction articles on UHF and microwave RF equipment, includes nine
codeless licensees in its list of 23 authors. (West German codeless
licensees are distinguished by DB, DC, DD and DG callsign prefixes).  In a
typical issue (April 1990) of \fICQ DL\fP,
the German amateur radio magazine, a
codeless license holder co-authored an article on improved data carrier
detection in amateur packet radio, and several others had technical and
operating columns on amateur television, packet radio and satellites.
The 1982 edition of the \fIRadio Communication Handbook\fP,
published by the Radio Society of Great Britain, lists three contributors
who hold codeless licenses (G6 and G8 prefixes). And
codeless licensees are frequent contributors to the AMSAT UK and
AMSAT DL journals.
.LP
Many holders of codeless licenses have contributed to the Japanese
\fIFuji\fP and the British \fIUoSAT\fP amateur satellite projects.  Nearly
everyone who has worked on \fIUoSAT\fP is a licensed amateur, and of these
approximately two-thirds to three-quarters hold British codeless licenses.\**
.FS
Dr. Martin Sweeting, G3YJO, \fIUoSAT\fP project manager, personal
communication.
.FE
In contrast, over twenty American technical volunteers contributed to the
design and construction of the \fIMicrosat\fP satellites despite holding no
amateur license at all.\**
.FS
Harold Price, NK6K, \fIMicrosat\fP software manager, personal communication.
.FE
These people clearly deserve Amateur licenses, but invariably they cite the
code requirement as the only reason they are not yet licensed.  And without
a license it seems highly doubtful that we will be able to maintain their
enthusiasm and willingness to contribute to future projects. How long would
you be willing to continue working for free on a project that you were not
allowed to use?
.LP
.ce 1
\fBThe Supposed "Advantages" of Morse Code\fP
.LP
Many opponents of a codeless license present long and varied lists of
the supposed advantages of Morse Code over every other form of amateur
communication. But the relative merits of the Morse Code are not the
issue here. Once again, the real question is whether someone who does
```

```
not know the code can contribute to the Basis and Purpose of the
Amateur Service, a question I answer with a resounding "Yes!" If the
Commission agrees, then it ought not continue the code's unique "veto
power" over every amateur applicant, regardless of the relative merits
of the code as just one of many operating modes available to radio amateurs.
.LP
Opponents of a codeless license must know that casting the issue in
these terms makes their position completely untenable, so they cloud
the issue. They try to steer the debate toward the merits of the code
as an operating mode, often making provably false assertions in the
process. Then when we rebut these assertions, the opponents set up
straw men and act as though we are trying to ban Morse Code entirely
from the Amateur Service! For example:
.QP
"Those just starting in amateur radio and those in foreign
countries can not always afford or have available the sophisticated
equipment needed for the higher-level transmission-reception
techniques....[the codeless license] discriminates against less
financially privileged amateurs." (Michael Migliaccio, N3HLM).
.LP
This is, of course, completely ludicrous. I know of no supporter of a
codeless license who would deny others the right to use whatever
operating mode they choose, including Morse Code. All we ask is a "live and let
live" policy. Morse Code is clearly a simple mode that requires inexpensive
equipment, and many people, including me, find it enjoyable.  Many
amateurs will continue using it voluntarily for these reasons.
.LP
I know I risk playing into my opponent's hands by responding to their
assertions about the merits of Morse Code as an operating mode. However, a
basic principle of propaganda is that even the most ludicrous claims
can gain credibility when repeated often enough; this is especially
true in a group as insular as US radio amateurs. No doubt these people
sincerely believe what they are saying. But this says much more about
the sorry level of understanding of fundamental communications concepts
and theory than it does about the merits of Morse Code.
.LP
So I am compelled to respond on the record to these bogus assertions
about the enormous superiority of Morse Code lest they carry undue weight with
the Commission. As many of the assertions were repeated by many
commenters, I have quoted only a few representative examples of each
type.
.LP
.ce 1
\fBMyth #1: "The Code Is An International Language"\fP
.QP
"One universal, international language in use today is Morse Code.
Persons who verbalize in different national languages can
nevertheless communicate using Morse Code." (William Smith, WB6SDE)
.QP
"CW allows people who do not speak a common language to communicate."
(Charlie Young, WA5VNV, page 2).
.QP
"The benefits of a code proficiency requirement ... include the
```

```
uniqueness of the Morse code as a universal language crossing all
cultural and language barriers..." (ARRL, page 3, footnote 4).
.LP
It is most unfortunate that even the ARRL is not above making this
silly argument.
.LP
Morse Code is a \fIcharacter set\fP, nothing more. It differs from the
the ASCII and Baudot teleprinter codes only in its use of variable
length codes (as opposed to the fixed 7-bit and 5-bit codes of ASCII
and Baudot, respectively) and in having a much smaller alphabet.
.LP
The claim for Morse Code as an aid to communication between amateurs
without a common natural language really stems from the standardized
abbreviations often used in Morse communications. However, these
abbreviations can and are used just as easily on packet or RTTY. \**
.FS
One might also say that language is seldom a barrier in Morse communication
because it is so slow and preoccupied with procedural overhead that
there is little or no time for the actual exchange of any real
information -- so a language barrier is never encountered!
.FE
.LP
In any event, given that most communications conducted by US amateurs
on the frequencies above 30 MHz are with other English-speaking US or
Canadian amateurs, it is difficult to see the supposed benefit of Morse
Code to Communicator licensees even if it \fIwere\fP an "international
language". Even in international communications (e.g., via satellite)
so many foreign amateurs already hold codeless licenses as to make the
code something less than a "universal language" - not that it ever was,
of course.
.LP
.ce 1
\fBMyth #2: "Morse Code Is Needed For Emergencies"\fP
.LP
.QP
"3. All hams must be prepared to use code in an emergency situation"
(Michael C. Migliaccio, N3HLM, page 1)
.QP
"When a power failure strikes computers and other digital equipment
usually does not function. But the newer solid state circuit radios
can be operated on battery power thus still enabling morse code
communications" (Michael J. Berry, N1FNI)
.LP
The transparency of these arguments is obvious is when you look at
several other major users of the VHF and UHF spectrum.  I know of no
Morse Code proficiency requirement for policemen, fire fighters,
paramedics and dispatchers, but these radio operators seem to have
little trouble handling emergency traffic.  Because they do it every
day, they're probably much better at it than the average amateur.
.LP
In another service, aviation, communication during instrument conditions
(IFR) is so vital that a radio failure is itself grounds for declaring
can emergency.  Yet even a commercial pilot who routinely takes
```

```
responsibility for hundreds of lives while flying IFR is not required to
know the code.  This is true even though VORs and NDBs (navigational
beacons) identify in Morse Code.  (A few do ID in voice, and in any event the
Morse Code identification is written on the navigation charts in dots and
dashes).
.LP
A more recent development, cellular telephony, has rapidly eclipsed
amateur radio in the number of emergency calls placed to public service
agencies, yet there is no code proficiency requirement for a cellular
telephone user.
.LP
Experience shows that most amateur radio emergencies are handled with
VHF FM voice communications; the rest involve either SSB voice
(particularly on HF) or health and welfare message traffic that is
ideally suited for packet.
.LP
Not only is the "Morse Code is needed for emergencies" argument
completely specious, but it actually works \fIagainst\fP the ability of
the Amateur Service to respond to emergencies. The code requirement
keeps out many otherwise qualified persons who could handle emergencies
with the same operating modes that present amateurs already use to
handle emergencies.
.LP
As for the emergency power argument, nothing precludes non-code
operations from using battery or other forms of backup power. Mobile
and portable radiotelephony equipment operates from non-utility power
sources as a matter of course (e.g., battery packs or automobile
electrical systems) and many fixed operations (e.g., voice repeaters)
also have backup power supplies. My own amateur packet radio station
has an uninterruptible power supply.
.LP
.ce 1
\fBMyth #3: "The Code Requires the Simplest Equipment"\fP
.LP
This argument is often presented in tandem with the "code is needed for
emergencies" argument. A romantic fantasy is usually painted of a
resourceful and clever amateur improvising communication facilities in
the aftermath of some dire catastrophe and saving the day. Naturally,
these facilities are only capable of supporting Morse Code, and the
simplicity of a Morse Code radio transmitter is heavily stressed. For
example:
.QP
"Morse Code is the most effective means of communicating and
the only one which can be used under the most adverse conditions.
In an emergency a person could get a message across with the use
[of] Morse Code by stripping two wires and touching them
together in a make + break fashion." (Alan Kaiser, N1API)
.QP
"CW signals will penetrate when all other forms of communication
is [sic] disrupted ... given a true emergency, a CW transmitter and
receiver is the simplest equipment to build, operate, or repair
and uses the least power. Given a true emergency, the modern
equipment may be made inoperable for any number of reasons.
```

```
If it does become inoperable, repairs could be impossible while
a simple transmitter could be constructed out of most junk-part
boxes which could summon help." (John Ridgely, WA3YVU)
.LP
The main fallacy in this argument is apparent from the old amateur
saying: "If you can't hear 'em, you can't work 'em." In other words, in
their zeal to promote the simplicity of the Morse Code \fItransmitter\fP,
the Morse Code
\fIreceiver\fP is usually ignored. Unfortunately, receivers (especially
those with the necessary frequency selectivity and stability for Morse Code
operation) are invariably much more complex than Morse Code transmitters.  If
simplicity of improvised equipment were the crucial factor, \fIAM
phone\fP, not Morse Code, would be the preferred mode. Only AM can be received
on the simplest (and most easily improvised) of all receivers - the
crystal set.
.LP
Nevertheless, the scenarios painted in these arguments seem awfully
contrived. I wonder how prepared these commenters actually are, or
whether they've ever participated in any emergencies themselves. Those
who have know that a far more realistic approach to emergency
preparedness includes a) having tools, spare equipment and power
sources on hand, and b) developing the technical skills necessary to
repair failures and to improvise solutions when possible.
.LP
.ce 1
\fBMyth #4: "CW is the most efficient operating mode."\fP
.QP
"1) Lower power required for DX (distance) communication [...]
.sp
"3) Most efficient means of radio communication [...]
.sp
"6) Spectrum conservation, uses fraction of the bandwidth.
Economy of bandwidth, CW uses 1/20 that of voice (phone.)"
(Michael C. Migliaccio, N3HLM, page 3)
.QP
"I do not favor a codeless license because the CW mode encourages
the construction of low cost but efficient transmitters and
receivers and useful contacts are made on CW with very little
power, thus complying with the Communications Act [sic] 97.313(a)."
(WO6I)
.QP
"[Morse Code's] spectrum efficiency and power-efficiency
as a communications mode..." (ARRL, page 3, footnote 4).
.LP
There are two problems with this argument. First, even if one assumes
that Morse Code is the most (bandwidth) efficient mode, why should this demand
code proficiency of all operators, even those operating only on the
underutilized upper VHF, UHF and microwave bands where bandwidth is
relatively plentiful? \**
.FS
This does not apply to the ARRL quote, since its context is
primarily that of HF communications; but the other comments make no
such distinction between HF and VHF/UHF operations.
```

```
.FE
.LP
But a much worse flaw in these claims, including the League's, is that
the basic premise is clearly and demonstrably false!  When compared
objectively with modern digital communication techniques, Morse Code is easily
shown to be neither power or bandwidth efficient.\**
.FS
A rhetorical question: If Morse Code were so 'efficient', why wasn't it chosen
for deep space planetary probes such as Pioneer and Voyager, easily the
most "QRP" (power-limited) communication links ever built?
.FE
.LP
Many people confuse "spectral efficiency" with "minimum bandwidth,"
e.g., by claiming that Morse Code is more efficient than SSB because it takes
less bandwidth. But a proper measure of efficiency must take into
account the rate at which information is being sent; most people talk
faster than they can send Morse Code, so it's reasonable that SSB should take
more power and bandwidth. The same is true for packet transmissions.\**
.FS
Admittedly, a true cynic might retort that amateur QSOs transfer no useful
information anyway, so that bandwidth \fIshould\fP be the sole criterion.
.FE
.LP
Appendix 1 contains a tutorial on the relative "Shannon Efficiencies"
of Morse Code and other digital modes. It shows that Morse Code is
extraordinarily
\fIinefficient\fP even in comparison to present amateur digital
communication techniques such as packet radio, which themselves have
substantial room for improvement.
.LP
.ce 1
\fB"Morse Code \fIis\fP Used Above 30 MHz"\fP
.LP
Some commenters point out that the code is occasionally used above
30 MHz. For example,
.QP
"Above 30 MHz, Morse Code is used extensively, for station
identification,
e.g., repeaters; for weak signal and microwave communications;
for satellite communications; for satellite bulletins; and for
propagation beacons." (Richard Bisbey, NG6Q)
.LP
Mr. Bisbey is correct that the code is used for these functions,
although
I would dispute his use of the word "extensively". Yet this argument
attacks a straw man; no one ever said that Morse Code is \fInever\fP
used above 30 MHz, only that it is an incidental mode that does not
justify a code requirement.
.LP
But to answer his specific points, many (if not most) repeaters
now identify with voice synthesizers, either exclusively or
in addition to Morse Code. Moreover, it is not really necessary that
operators be able to copy these IDs in order to use repeaters
```

```
effectively;
the fact that so many repeaters identify at speeds well in excess of 5
wpm,
the speed required for the Technician class license, illustrates this.
Furthermore, paging services in the Land Mobile service often identify
in
Morse Code, but there is no requirement for code proficiency to use a
pocket pager.
.LP
As for the other uses of the code above 30 MHz, they are by no means
exclusive. They still do not justify a code requirement for amateurs
interested in alternative modes of communications any more than the use
of ASCII in amateur packet radio would justify requiring all operators
to memorize that character set.
.LP
Most satellite communications now use single sideband (SSB),
except for the \fIMicrosat\fP satellites that use packet radio modes
exclusively.\**
.FS
The \fILUSAT\fP satellite (one of the four \fIMicrosats\fP) does carry
a
Morse Code beacon, but it has been turned off in favor of the 1200 b/s
digital
packet stream because the latter makes much more efficient use of the
satellite's resources.
.FE
As for microwave communications, it is unlikely that Morse Code
operations
will ever take up more than a tiny fraction of the available spectrum.
Potentially far
more important and effective uses of this almost idle spectrum can
be seen in the high speed digital communications experiments now being
conducted by Bdale Garbee, N3EUA; Glenn Elmore, N6GN; and Kevin Rowett,
N6RCE. They have built and tested prototype 2.5 Mb/s digital links that
show enormous potential for use in "backbone" integrated voice, data
and image networks that could revolutionize amateur radio, particularly
as an emergency communications service capable of handling large
amounts
of traffic.
.LP
In short, although Morse Code is used by a tiny fraction of
communications
on the frequencies above 30 MHz, it is far from an essential skill
for the radio amateur using those frequencies. Alternative techniques
exist and new ones are being developed. Those who wish to learn
and use the code will still be allowed to do so, but there is no reason
to
force it on them.
.LP
.ce 1
\fBFull VHF/UHF Privileges Should Be Granted To Communicators\fP
.LP
Although I did not try to keep a precise count (the bulk of the file
and the presence of many duplicate copies of filings made this
impractical) it appears that a majority favors some form of codeless
license. And there is, of course, a highly vocal minority that opposes
a codeless license in any form. However, I discovered a most
interesting fact: an overwhelming majority of those who did favor some
form of codeless license felt that full privileges above 30 MHz should
be granted. Even several commenters who opposed a codeless license felt
that if it were to be created anyway, it should carry all privileges
above 30 MHz.
.LP
The ARRL states
.QP
"...the League's ascertainment of amateur licensees' attitudes
about a codeless license indicated that there was a great deal
of acceptance of a codeless license if the privileges were
limited to frequencies above 220 MHz. Support dropped off
significantly for such a license with privileges below that
frequency band..." (ARRL, page 16).
.LP
My examination of the file would seem to belie this claim. Either
amateur
sentiment on the codeless license has polarized considerably since the
ARRL gathered its statistics, or the ARRL surveys were designed
primarily to gather support for its own half-hearted proposal.
.LP
The latter would seem to be the case.  For example, the member survey
distributed in the ARRL Hudson Division (where I live) contained
check-off responses providing for complete opposition to a codeless
license; support for a codeless license as proposed by the ARRL's study
committee (220 MHz and up, plus limited packet privileges on 2m); or
support for a codeless license more restrictive than that proposed by
the study committee. There was no check-off response to express support
for a codeless license granting full VHF/UHF privileges.
.LP
The fact that the ARRL has advocated these illogical restrictions on
the proposed Communicator belies its claim to having submitted a
"cohesive plan". It is clear that the League was caught between two
rival factions: those who support a codeless license on all VHF/UHF
frequencies and those who oppose it entirely.  The League proposed to
restrict the Communicators to 220 MHz and above primarily to lessen the
opposition from the anti-codeless faction, since few from this group
operate on those bands.
.LP
It is clear that the real reason some amateurs oppose granting full
VHF/UHF privileges to Communicator licensees is their perception that
the 50 and 144 MHz bands are too "full" to support additional amateurs.
Indeed, 144 MHz is the only VHF/UHF band many amateurs use.
And some others, including the Sidewinders on Two, William Tynan W3XO
and AMSAT, are specifically concerned about
possible interference to weak signal work on these bands.
.LP
But none of these concerns constitute valid arguments against granting
full privileges above 30 MHz to Communicators.  Communicator licensees
```

will have passed a written exam equivalent to or more difficult than
the Technician Class which does grant full privileges above 30 MHz.
These licensees should therefore be no less able to
adhere to FCC rules and regulations and to voluntary band plans.
Given the rarity of Morse Code in operations above 30 MHz, denying the
Communicators access to the 50 and 144 MHz bands can be seen only as as
a
form of "protectionism" for a small special interest group, i.e., those
already licensed who now enjoy relatively exclusive use of the 50 and
144 MHz
bands.
In other words, NIMBY - Not In My Back Yard - is the dominant principle
here.
.LP
This is not to say that the gates to amateur radio should be thrown
completely open. As discussed earlier, amateurs must exhibit a certain
minimum level of technical proficiency if their use of the service is
to further its reason for being. And highly worthwhile activities do
go on in the weak signal band segments. But even if, in order to
prevent overcrowding, it were deemed necessary to increase the
difficulty of an amateur exam above the minimum levels, there are far
more constructive ways to do it than by retaining a code test. For
amateur radio to serve the broader public interest, the skills
required for an amateur license should promote development of the
service and of the individual in a way that maximizes the benefit of
the Amateur Service to the outside world. Code proficiency is
virtually irrelevant outside amateur radio, therefore maintaining a
code requirement is indefensible even as a means of preventing
overpopulation of the amateur bands. If overpopulation is the
problem, then increase the \fItechnical\fP qualifications instead.
.LP
Furthermore, I believe the concern about overpopulation is overstated.
The file contains many comments from amateurs living in rural
areas who report that much of even the 144 MHz band goes idle. For
example:
.QP
"There may be those who say this would cause the popular FM
repeater frequencies to become too crowded. However, I live in
the rural area of Northern Wisconsin, ...
and we welcome any additions to the number of hams and the number
of repeaters." (William P. Volm, KD9HH)
.LP
Much of the congestion that does exist on the 144 MHz
band in larger metropolitan areas
is the result of highly inefficient spectrum management policies.
The burden of improving spectrum efficiency and of developing the less
used upper frequency bands should be shared equally by \fIall\fP
amateurs. One's level of code proficiency should be irrelevant.
William Volm continues:
.QP
Perhaps allowing the use of 144 MHz and above for
these "codeless" hams would cause us to better utilize other parts of
the VHF and UHF radio spectrum in the city as well as the country.

```
If 2 meters becomes more crowded we will just begin using other bands
we may not be using as much of now.
So I don't really see this as a threat but as a help to better
spectrum management."
.LP
.ce 1
\fB"The Glory of Morse Code"\fP
.LP
In order to close on a somewhat lighter note, I would like to respond
to one more statement I found in the file:
.QP
"I believe everyone should be blessed with the glory of learning
code before operating in the amateur frequency spectrum."
(D. J. Ray, N5FRN)
.LP
Finally, a comment that puts in eloquent words what so many who oppose
the codeless license seem to feel. With the words "blessed with the
glory" Mr. Ray expresses what can only be a religious attachment to the
Morse Code. However, the First Amendment to the Constitution of the
United States reads:
.QP
"Congress shall make no law respecting an
establishment of religion, or prohibiting the free exercise thereof..."
.LP
Given the religious attachment that Mr. Ray and many other amateurs
clearly have for the Morse Code, it would be unconstitutional for the
Commission either to ban the use of Morse Code by Mr. Ray or to require
other amateurs to follow his religious practices. The code
requirement is therefore in violation of our Constitutionally mandated
separation of Church and State, and the Communicator license must be
implemented without delay.
.LP
More seriously, all I ask is for the Commission (and the members of the
Amateur Service) to allow each amateur to pursue the Basis and Purpose
of the Amateur Service in his or her own way.
.LP
Respectfully submitted,
.sp 3

\fBAppendix 1 - The Shannon efficiencies of Morse Code and other digital
modes\fP
.LP
About forty years ago, Claude Shannon of Bell Labs launched the field
of Information Theory with a foundation paper on the mathematical basis
of communication. His paper introduced a formula that is now
universally accepted as being to communications what E = mc^2 is to
nuclear physics and the Laws of Thermodynamics are to engine design.
What Shannon found was the ultimate limit imposed by nature on the rate
at which digital information can be sent through a noisy,
bandwidth-limited channel.  Here is his formula:
.IP
     C = B * log2(1 + S/N)
.sp
where
.sp
C = channel capacity in bits/second
.sp
B = channel bandwidth in hertz
.sp
S/N = numerical signal-to-noise power ratio (e.g., 30 dB corresponds
to a power ratio of 1000). "Gaussian" (i.e., "white") noise is assumed.
.sp
log2() = base 2 logarithm (You can compute this on your pocket
calculator by using base-10 logs and dividing the result by .301,
the base-10 log of 2.)
.LP
For example, a 3 KHz channel with a 30 dB S/N ratio has a Shannon limit
of
.IP
3000 * log2(1 + 1000)
.sp
= 3000 * 9.96
.sp
= 29.9 kilobits/sec.
```

```
.LP
Unfortunately, Shannon's formula doesn't give a communications engineer
much
more than a hint about how to build a system that operates at the
theoretical limit, just as the Second Law of Thermodynamics doesn't
really
tell a turbine designer how best to shape his blades. But both are
useful
benchmarks for looking at the efficiencies of various systems, and they
tell
you how much each system could be improved. For example, the figures I
just
gave are typical for a dialup phone line. Modems are now readily
available
that operate at rates of 10,000 to 15,000 bits/sec over these lines, so
you
can see that they are already operating at 33% to 50% of the Shannon
limit.
I will call these percentages the "Shannon efficiencies" of the system.
.LP
If someone advertises a modem operating at 100,000 bits/sec over
ordinary 3
KHz 30 dB S/N dialup phone lines, you can safely take it as either an
April
Fool's joke or a fraud.  It is vitally important to understand that you
cannot build a system that exceeds the Shannon limit any more than you
can
build a perpetual motion machine; it doesn't matter whether the
"receiver"
is a machine or the human ear and brain.  (Perpetual motion is actually
more
than just an analogy here; there is an interesting link between
information
theory and thermodynamics that is outside the scope of this document.
Read up
on "Maxwell's Demon" in a physics textbook if you're interested).
.LP
Now armed with this background, I can return to the original subject.
Let's see how efficiently a Morse Code signal uses its channel. I'll
assume a
bandwidth of 400 Hz (a typical CW filter) and a S/N ratio of 10 dB in
this bandwidth. I'll also assume a transmission speed of 20 WPM. From
my own experience I can say that this represents reasonably comfortable
copy.
.LP
The Shannon capacity of the channel is
.IP
400 * log2(1 + 10)
.sp
= 1384 bits/sec
.LP
The Morse alphabet has 58 characters, including space and seldom-used
punctuation, so each character could be represented as a 6-bit number
```

with room to spare (2^6 = 64). The standard word "PARIS " sent 20 times in one minute is 120 characters/minute, or 2 characters/sec. At 6 bits/character, 20 WPM Morse Code is therefore about 12 bits/sec of information, for a "Shannon efficiency" of 12/1384, or only 0.87%.

.LP

In comparison, the TAPR/AMSAT PSK modem (designed for the \fIFuji\fP and \fIMicrosat\fP satellite downlinks) operates at 1200 bits/sec. It requires a bandwidth of about 1800 Hz and a S/N ratio of about 10 dB to work well. Such a channel has a Shannon limit of about 6227 bits/sec, so this modem operates at 19.3% efficiency. Even though this figure isn't particularly high in comparison to the phone line modems mentioned earlier, it blows away the Morse Code figure I just computed. (The reason this modem isn't as good as the better phone line modems has to do with the choice of a much simpler coding and modulation scheme that could be implemented easily in inexpensive analog hardware. The fast phone modems make heavy use of Digital Signal Processing, or DSP. As we apply DSP to amateur radio, modem efficiencies will rise considerably. But if I pick a weaker competitor, e.g., the 1200 baud Bell 212A modem, our modem does well -- the 212A is only about 4% efficient.)

.LP

Why is Morse Code so inefficient? There are several reasons. First is the design of the code itself. It takes anywhere from 4 to 26 "channel bit times" to send each character (4 for the letter "E", 26 for the digit "0"). Even when the various character lengths are weighted for their frequency of occurrence in English, the average Morse character is 8.3 bits long, slightly more than ASCII with the parity bit -- even though ASCII has a much richer alphabet (128 characters vs 58).

.LP

Second, the on-off keying used with manually copied Morse is inherently less efficient than the continuous-carrier phase or frequency shift schemes generally used with machine-copied signals. The average-to-peak signal power ratio is low, so the transmitter is not used effectively and the error rate suffers. (Of course, some CW transmitters cannot handle continuous output, which mitigates this difference.) On-off keying also has two other serious drawbacks, such as the difficulty in setting a detection "threshold" (deciding whether the signal is on or off) in the presence of fading and the inability to gain the additional 3 dB in performance that comes with "coherent carrier recovery." The latter technique involves phase-locking a local oscillator to the incoming carrier frequency so that noise and QRM with different phases can be rejected. This is obviously not possible with manual reception. What is commonly known as "Coherent CW" is coherent only in the element (bit clock) timing, not the RF carrier phase; it's hard to stay phase locked to a carrier that keeps switching off for long periods. But coherent clock recovery is done in virtually all synchronous digital modems, and coherent carrier recovery is standard practice with high performance modems such as the TAPR/AMSAT PSK modem.

.LP

The third and most significant reason for Morse Code's inefficiency is the human brain's requirement for considerable "excess bandwidth" to make the beginning and end of each code element (dit or dah) crisp and easy to copy. CW filters are seldom narrower than 400 Hz, even though 20 WPM CW could theoretically fit into a 24 Hz channel.

.LP

In contrast, digital signals that are designed expressly for computer reception can make much better use of both signal power and bandwidth than Morse Code. Starting with the encoding of the source text information, 50%-70% can be shaved right off the top by applying a compression algorithm (e.g., the popular PKZIP program for the IBM PC). The average character size for English text drops to only 3-4 bits, despite the larger alphabet. Unlike the abbreviations commonly used with Morse Code, this compression is fully reversible; the original, uncompressed characters come out of the decompressor at the receiver.

.LP

The Shannon formula shows that channel capacity depends on both the bandwidth and the signal-to-noise ratio. Depending on which you have more of, you can trade off one parameter in favor of the other. FM is a familiar technique for doing this with analog signals. But many more options are available to the digital designer. For example, when power is precious, forward error correction coding (FEC) can be used to lower the required signal power at the expense of increasing the required bandwidth. (One scheme used for deep space communications lowers the required signal power by 8 dB but triples the required bandwidth. Less drastic schemes require less bandwidth, but give correspondingly less "coding gain".) When bandwidth is limited but S/N is good, you can make the opposite trade by sending more than one bit at a time. This is common on telephone modems. Sometimes the two techniques are combined, as in the new V.32 9600bps phone modems.

.LP

Irrespective of S/N-bandwidth tradeoffs, computer-based digital systems can be scaled to operate over a much wider range of speeds and signal levels than is possible with the human ear. Everyone knows that computers can operate at speeds far higher than human-copied Morse Code. Not as well known is that they can go much further than humans in the opposite direction: recovering slow but extremely weak signals. (The slower a digital signal, the less bandwidth it occupies. The narrower the signal, the narrower the receive filter can be, and the less noise it will "let in" to interfere with the desired signal. Hence it is theoretically possible to copy an arbitrarily weak signal -- as long as you slow it down enough.) But it is well established that the trained human ear/brain can "filter" down only to effective bandwidths of 50 Hz or so.

.LP

Machine reception has no such inherent limitation. For example, the TAPR/AMSAT modem could, through proper scaling of component values, operate at 12 bits/sec -- the equivalent of 20 WPM Morse. It would only require about 18 Hz of bandwidth and 20 dB less signal power than for 1200 bits/sec. In the original 1800 Hz bandwidth, this signal would be 10 dB below the noise! Yet the modem would work just as well as before -- only slower. The only problem here is that narrow analog filters tend to be hard to tame, and this modified modem might not work well in practice.

.LP

Here DSP comes in. DSP filters are inherently far more stable and predictable than their analog cousins, and there is effectively no lower bandwidth limit to such a system. For example, several years ago Bob

McGwier, N4HY, wrote software that demodulated 4 bit/sec digital signals sent from the Soviet Vega balloon probe as it floated through the atmosphere of Venus. These signals were so weak that they weren't even audible when played back through a speaker, yet Bob's software recovered them perfectly!

Bob and Tom Clark, W3IWI, are now bringing these same techniques to amateur radio. In an early demonstration, Bob and Tom worked each other off the moon on 432 MHz using only 100 watts into single yagis -- Oscar class stations, not your standard EME setup! The secret was digital signal processing on the receiving end that made it possible to detect a signal that was, to the ear, completely buried in the noise. The Shannon limit was not violated (i.e., the information rate was VERY slow) but at least DSP made it possible.

Subject: Hawaii Repeaters (for AA4MW)

Couldn't get this thru direct, sorry 'bout that...

Mike,

Here's a list of some of the more active Hawaii repeaters, based on my experience on 2 meters. For 440, I've pulled listings from the RD based on linkages with other known active systems...

Honolulu:	146.98	City Hall	444.5+
	146.88*	Diamond Head	444.1+
	147.12	HTCARC	444.0+
	147.28		444.45+
	146.76	North Shore	448.0-
	146.94*	Haleakala, Maui	
Hilo	145.35		449.75-
Kailua-Kona	147.16		
	146.82*		
	146.88		

* indicates state-wide link via 444.15/449.15; Big Island end may not be up by the time you get here.

Also -- Emergency Amateur Radio Club (EARC) net meets nightly at 1930 local on 146.88 and 146.94 systems...you're quite welcome to check in.

73,
Jeff WD6CQV/KH6 AFA8JM

added note for info-hams -- if I'm wrong about some of this, KH6R or someone else wil probably let me know :-)!

I just came into possesion of a Redicom XF742 6-channel, crystal controlled, 25 Watt UHF radio. It looks like it was originally on RX 463.750 (TX +5) with PL. There is also a marking on the heat-sink that says "UHF-L"

I would like to put this radio in the 440-460 area. Does anyone know if there is a source for Redicom schematics/service manuals?

Thanks in advance!

To everyone who sent me mail, or posted replys to my aviation/ham transceiver question: Thanks!

Unfortunately, the quest was a doomed one. I called virtually every manufacturer and dealer to no avail. Bendix-King and others make a marine/ ham tranceiver.. but it's not quite what I was looking for. Aszden makes a 2m mobile that also RECEIVES aviation, but again... not quite.

Well, it's nice to have a definitive answer. Now I have to think about which radio to buy first!

Another quick question... Exactly which punctuation and prosigns do I need to know for the code test?? "Tune in the World" has NO description of the Morse Code in a character <-> pattern list !? Neither do the other popular Novice or Technician manuals I've purchased. I finally used the Encyclopedia Britannica as a reference.

Regards,

-Rick-

I was just curious whether the current FT-470 mods will allow receive coverage down to about 411 Mhz. I'm interested in this because if (when) I get one I'd kinda like it to replace my scanner and Toronto FD is 411-412 MHz (414-415 Access).

>MAKE YOUR FILES AVAILABLE FOR FTP OR MAIL TO INDIVIDUALS PLEASE!
>THANK YOU.

Well, gosh, I thought it was nice. It's PC and clone thereof specific, of course, but enough of us run such boxes that it seems worthwhile to me.

I see nothing wrong with this, as long as it doesn't become so widespread and frequent that it generates unreasonable load on the net. Considering the level of traffic that constitutes nothing but mutual flaming on some of the "philosophical" (read: political and religious) groups, I can't see cause for complaint. It's not as if you had to _read_ those uuencoded files. The 'n' key is located one row down, and just to the left of your right index finger....

Now, while I uudecoded it on a mainframe, I _could_ have downloaded the encoded file and extracted the compressed file on my PC. I didn't, on account of because the .zoo file is much smaller, and therefore transfers to the '286 box here at n5gax much faster.

It's a nit, but I can't resist...those WERE text files. That's what uuen/decode is all about -- they make a binary file into a text file guaranteed to be transmittable over even the oldest (insert your favorite malediction here) mailer and news software. Can you say "downward compatible"? I knew you could....

Perhaps I should curb the sarcasm a bit...I don't _know_ what you're using to read the news. You might actually have to go through every file line-by-line, but I figure that's only if your using a mailer that runs under OS/360 JCL.

So, my remark is "Thank you, Mark."

2000 millicents, on the barrelhead.

73s,
d

PS -- Perhaps I should have asked: "Can you say upgrade?"

AO-10: Alamanac Data

de DB2OS @ DK0MAV

OSCAR-10 ALAMANAC DATA

by James Miller G3RUH

Oscar-10 can no longer be commanded due to its damaged memory. However it's on the Mode B transponder all the time and provides very useful service. Apogee lies close to the Equator (like it was at launch). The attitude is "back to front", i.e. Earth pointing at perigee.

The table below lists relevant operational parameters. It is important to realise that the current attitude (and hence Sun angle) is extrapolated from the last known attitude, which was in January 1987, nearly 4 years ago. The true attitude isn't far off.

The governing factor is the Sun angle. If this exceeds 45 degrees, the the solar panel illumination is too low, the battery voltage falls, and the beacon starts to warble.

Thus the APROXIMATE time when AO-10 is expected to be healthy again is 1990 Nov 17 - 1991 Feb 09. Listen to the beacon to make sure.

	Attitude		Sun Angle	Sun's Position		Eclipses		
DATE	ALON	ALAT	SA	SEL	SAZ	Dur min	MA in	MA out

 Notes:
 ALON/ALAT are the spcecraft's attitude in orbit plane coordinates.
 SEL/SAZ are the Sun's position, also in orbit plane coordinates.
  Eclipses occur when SEL is around 0 degrees, i.e. the Sun lies in the
  orbit plane.
 SA is Sun angle, the angle the Sun makes with the solar panels.
  Illumination (%) = 100*SIN(SA)

Awhile back, when HR ceased publication, there was a considerable thread of discussion in this group bemoaning the loss of a ham-oriented technical publication that Ham Radio magazine represented.

I have received a letter from Terry Northrup of CQ Communications, Inc. Greenville, NH which announces a quarterly she names Communictions Quarterly--The Journal of Communications Technology.

This letter was addressed to authors who have been published in Ham Radio (and presumably others on this net also have received this letter).

The letter runs nearly two full pages and I will copy just a few paragraphs just to give a flavor of this announcement and what is proposed.

Terry also informs me that promotional material is being mailed to all former subscribers of HR and to the current subscriber list of CQ magazine.

Forrest Gehrke k2bt

September 5, 1990

Dear Author:

....

When HAM RADIO Magazine ceased publication this June, Amateur Radio lost a valuable outlet for sharing your technical expertise, new theories, and projects. I'd like to offer you a new opportunity to reach dedicated Radio Amateurs--those constantly looking for technical challenges, not contest results or news and views.

....

You now have a unique opportunity to reach this audience by writing for our new publication .....The Journal of Communications Technology. This new journal, scheduled to premier mid-November 1990, is geared to explore, in-depth, areas that none of the other Amateur magazines are currently covering. I'm looking for articles which push the technical envelope to the limit. I'd like you to share your knowledge of electronics and communications in such areas as direct digital synthesis, digital signal processing, computer control, high speed data communications, and computer-generated antenna design. A desirable article will show how new, state-of-the-art developments relate to the current Amateur Radio operations.

....

Each issue will have approximately 100 pages of editorial material; advertising will be strictly limited. Articles will flow from page to page without the distraction of ads placed in the middle. ....

And, of course, you'll be paid for your efforts. We pay $40 per printed page...........

So, how about it? Can I count on your help to ensure that

Communications Quarterly presents the best technical
articles available?

Terry Northrup KA1STC

I have noticed that my PRO-34 is not as sensitive as some of
my other scanners. In particular, on the UHF band around 460MHz.
Has anyone else noticed this problem. The manual says the sensitivity
is only 1uV....not particularly stellar performance.

BTW I have also noticed that image rejection in the 800MHz band is
stated as "not specified" making me think that the PRO-34
probably has prettly lousy 800MHz image rejection...since I can
hear cellular images on my unmodified '34.

Inquiring Radio-roids want to know......

Richard,

I couldn't get mail back to you, either. What came through looks like it forgot to decompress. Anyway, in my 3000, on the "TX" pc assy, (not the power amp) look for Q436, a 74C00 IC. Near it should be a couple of pots, VR412 (tone freq), and VR411 (output level). Test point 406 will show you the freq, but not the level. The osc. runs only with the PTT line low (xmit). It has been many moons since I've been in there, so I can't describe it any better. This is just from the schematic. As you can probably tell, this 3000 may be different than the basenote author's. This radio has the whole thing built in from the factory with a "TONE" on/off switch on top of the control head.

By the way, I've already copied the manual, schematic, and TT stuff. For the price of postage, you can have it. I'm probably NOT good in the book. I don't even have a book. Send me your addr. if ya want this stuff.

Bill

(Hmm. Guess I did not try hard enough back in high school when I tried it!)

Anyway, just in case nobody has mentioned the magazine, it was either
Modern Electronics or Radio Electronics, my (faulty) memory tells me
that it was M.E. and not RE. (But my memory has been wrong before)

(On a vaguely related note-I was surprised by the change in the format
in Radio-Electronics this month! It suddenly got thinner :-(, or
so it seemed to me.)

'nuf blathering for now... gotta get back to work! :-)

I was told by a Peace Officer friend of mine, that they are being discourged
from using this type of license plate frame. With all of the world turmoil and
possible terrorist activities suggestted by some folks in other parts of the
world, these frame may tend to become targets. Whether this is true or not I
wouldn't want to guess, but if I would have to choose between a ticket for
doing something stupid on the street and being blown up by a terrorist, I think
I would rather pay with money than my/my families life.

Now that school is back in session, it might be time to start thinking
about "hooking up" a few of the university clubs around the globe.

I'm STILL interested in seeing if we can set up a chess tournament
by amateur radio. If not Chess, then GO, which is very popular at
R.I.T. It would not only be good to let other groups within the
schools know about the ARC, but it's good PR, too. It would be even
better if there was a club outside the U.S. (obviously, who shares a
third party agreement with the U.S.). Sound worthwhile? Drop me
E-MAIL, PLEASE!

Second thing: whoever is responsible for the HAM-UNIV mailing list,
(is it you, Phil?) - does it still exist? It might be a good time to
post a blurb on what it is, who it's for, and how to use it.

Finally: I'm interested in setting up a net for university ham clubs.
But, I don't want to do the work. (Aren't I a squeaker?) Again, is
anybody interested ?

As usual, I'm available as cep4478@ultb.isc.rit.edu or to my CCI (work)
address, or by telephone. Best 73's

Christopher Piggott, WZ2B
President

Obviously my staement was a little mis-understood.

I am not saying HEATH should have been cheaper cause it was a kit.

I am asking why it costs MORE than a comparable piece of equipment
designed and built buy the same off-shore companies.

Oh Well. I'll miss them anyway. I wonder if this will make my HW-101
worth more money as a collectors item?? :-) :-)

you folks really got my curiosity up now.

In the past, several people have posted files (non-text type) incredibly long
to this newsgroup and gotten flamed to a cinder for it. I don't know how most
of you read this newsgroup, but here we get a digest of so many mesages all in
a row, and it comes as one long message. This thing is displayed one 24 line
page at a time and you hit return to get to the next page. If you hit 'N', you
end that digest and go to the next one. There is no way to reply to individual
messages, nor include them in your reply without retyping the whole thing.
This is a VAX/VMS system with over 1600 accounts and over 4000 users.

Did the other folks who commented on these postings get flamed as bad as me?

Oh well, That's life. I guess if I can page through endless pages of garbage
on no-code, is Pump up the Volume really bad for ham radio, and whether or not
I can use my radio on an airplane, I can page through fourteen tons of
uhrvg;ondm picrjgih r cjehhv;jcu4coyy37yedddh iuyp97y5u d jkrhjjehkv;jn ;jhj
type stuff.

first Amendment and all that i suppose. isn't America wonderful? i can't pray
in school, but I can sure cuss people out and tell them where to go.
(oops wrong newsgroup, thought I was in rec.ACLU)

Anyhow, ya'll have a nice day and I'll crawl back into my Nomex Bunker gear.

murphy@ufp.dco.dec.com (Rick Murphy)

is the only person to have replied to my note about the horrendous QRM in the 15m CW band (I guess everyone else is too busy posting other stuff to the net, homebrewing, and drafting the next set of ham radio rules :-)).

In article <37005@ut-emx>, oo7@ut-emx (Webster Smogpule III) writes:
|>   Recently I have been hearing some very strong QRM on 15m that wipes out

|>
|>   Anyone else heard this (you must have...), and have any idea what it is?

FCC says it's in the middle east. Most likely Iraq. Encrypted teletype.
It's big-time loud here on the east coast.
     -Rick WA1SPT/4

I was just about to post something like this when Rick's posting appeared. AA5ME in Dallas called the FCC last Friday, they got fixes on it from six stations and said it is roughly on the Syria-Turkey border, close to Iraq. I heard it again today, centered on 21005, and this time it was more radar-like, with bursts of what sounded very like our old friend the Woodpecker. It was S9+. Obvious guess is that it could be US radar, and a more obvious guess is that they will not turn if off for the hams...

If you haven't come across this yet, be prepared for a nasty shock. AA5ME says it went on for many hours in the afternoon (that's when I've heard it). It must be Megawatts. You may as well forget about 15m during the next CW contest (did anyone wake up?).

Perhaps it's unpatriotic of me to mention about it - I suppose it's just keeping the world safe for democracy and Exxon.

This raises a side of electronics that has been a quiet revolution. It is also something that has made it as cheap to make stuff in Switzerland as Malaya. I am going to try to be brief here so forgive me if I miss anything.

Back in the 60s when most of my generation were taking drugs and telling me they had learned how to "communicate" I was learning that "electronics" was one of the most labour intensive industries. These were the days when PC boards were coming in, but many companies like Tektronics were still making stuff with glowfets and point to point wiring. Building radios and stuff was a semi-skilled activity. It took a large amount of time to build and align a Collins S line or Racal RA-117 radio. This is what had to be paid for. Labour was a major part of the cost of an electronic device. In these days, Heath was a deal because the i supplied the labour and called it pleasure.

Then PC boards and ICs came in and the labour to function ratio went to hell. To reduce labour further, automatic assembly and test equipment came into being. So these days instead of rooms full of women with smoking soldering irons we have halls filled with automatic machinery stuffing multilayer boards, soldering them and testing them. Whackity-whak and out comes an XT board that retails for $80.00. A receiver in a chip costs $3.50.

The last product that I ever worked on getting to market was an answering machine with combined phone and dialer. The device had 45 mins of human labour time total and that includes packing it into the box and driving the forklift to the dock. So if we assume that the same answering machine were offered by Heath, this is an idea of the cost savings: Labour at Heath to pack and ship 15 Mins. Labour at Phone factory to make, pack and ship 45 mins. Heath savings: 30 Mins. Labour cost (padded) $7.50 per hour. Savings: $3.75 . Considering that such a device would retail at K Mart for probably $115.00. It is hardly worth to saving $3.75 to spend hours building by hand what a machine can whack together with greater precision in only a few minutes.

That should explain why Heath is not such a deal these days. The break they gave you was on the manufacturing labour costs and those costs have gone away. Also to be considered, but not part of this is the impact of Surface Mounted Devices on manufacturing and repair.

Unlike sites slopping on the government trough, a lot of Usenet
does not have Internet access, and can't FTP anything.

If you're going to be dictatorial about how people should use the
net, recommend something realistic like posting to comp.binaries.*,
alt.sources, or comp.sources.misc and posting an announcement in
the relevant groups.

On the other hand, consider a product that still requires a lot of
mechanical assembly, like a kilowatt amplifier. You can still save
a lot of labor cost by building one of these yourself, either in

kit form, or totally homebrew.

Actually you press some buttons and turn the radio on. This enables
out of band receive. It is not neccessary to hold any keys down while
receiving. And yes it will demodulate AM aircraft fine. Incedently,
SF bay approach (135.65) comes in fine even though "U" is displayed in
the memory display. There are mods to do out of band transmit; again
key press and turn power on; no diodes to cut. However, transmit in AM mode?
Don't think so.

When I worked for a DoD contractor I saw a similar setup used by the US Army.
Grounding was real bad in places like the Central Washington desert and
they came up with a scheme of using 15 or so short 10 inch copper stakes
that were T shaped. The top of the T was to allow them to be driven in with

your foot. They were spaced about 3 feet apart and used tined copper
wire to connect them together. The stakes just had a hole in the top for
the wire to pass though. No solder. I suppose the theory was that when
driven into the ground the wire would be pressed against the copper stake.
Supposedly it worked well. Note that this was the result of an extensive
and no doubt expensive investigation into proper grounding. (Actually
probably not very expensive by military standards as the project was
very "skunk works".)

Not everyone has FTP access. (Or is it just me!) Why not post to
comp.binaries.ibmpc ? And likewise comp.binaries.mac for mac based stuff?
I don't recall exactly what the upload formats are (uuencoded zip, I think)
but I am sure there is an article there describing upload formats.

I suppose not everyone subscribes to comp.binaries.xxx.

I'm having a problem learning the code for my novice ticket. I'm using
tapes and when I miss a letter or two, the tapes advise me to re-wind and
do those sections over again. The problem is, I then know what that says!
It's not doing me much good as I already know what all the letters will be.
Now certainly, just hearing the DiDah patterns and writing the letter, even
when you know what the letters will be, is helping, but I wonder if there
is another way to get pratice.. on just those letters that are goofing me?

Would that I had a IBM PC or C-64 computer, I understand there are
programs, but I have an Amiga.

Any tips on learning code and getting pratice on just the letters I know?
I tried tunning into the ARRL code pratice and the novice bands, but as I
only know A,C,E,H,I,M,N,O,P,R,S, and T so far, its tough.

Six weeks to exam time!

Sb: Another two-wire CPO

Here's another way to have a two-wire code-practice system, but without the "sidetone" buzzer (saves battery power).

the "sidetone" buzzer (saves battery) power>

1. Wire the key in series with a battery, negative side of the battery to the key.

2. Wire a diode in series with a buzzer, cathode to the buzzer.

3. Parallel the key/battery combo across the buzzer/diode combo.

4. Repeat the above steps for the "other" end circuit, except reverse the polarity of both the battery and the diode.

5. Now connect a wire pair between the ends of the paralleled combos.

NOTE: with this circuit, be sure to NOT close both keys at the same time because it will connect both batteries in a series short-circuit.
When one key is closed, the diode on that end is reverse-biased and so no current will flow thru that buzzer. However, the diode on the opposite end will be forward-biased, causing the buzzer to sound.

Yes. I don't remember them, but I'm sure they're listed in QST or somewhere in the ARRL voluntary bandplans.

THE ARRL LETTER - Volume 9, Number 17 - August 24, 1990 - PART 1 OF 3

Nets Get More Time to Resolve Disputes

The Federal Communications Commission has granted several nets operating on the 20-meter band more time to resolve their on-going disputes.

The FCC entered the 20-meter dispute late last year when it sent letters to 19 net and bulletin station managers (including W1AW, which is not involved). A second FCC letter to nine of the managers asked them to come up with a plan to resolve the disputes, which have been occurring for some time.

Responses from five of the managers were received by the July 1 deadline.

FCC's Robert H. McNamara, chief of the Commission's Special Services Branch, wrote on August 9:

"The Commission has received five individual plans addressing the underlying causes of unproductive on-the-air disputes that were taking place on the 20 meter amateur service band. It is obvious that the amateur community desires that the disputes be resolved amicably and that potentially restrictive rule making be avoided. It appears, moreover, that there has been progress in resolving the disputes.

"The plans recommend" the FCC letter continues "that the amateur community be allowed to continue addressing this problem internally. Interest in this approach as a model for future dispute resolution in the amateur community has also been expressed by other observers.

"Because rule making could limit the flexibility that amateur operators now enjoy, it is important that you succeed in this activity. I believe that the requested extension of time is warranted. Correspondence from other amateur service licensees indicates that they, too, are interested in assisting with the development of the amateur community's plan. Therefore, I am extending until February 1, 1991, the date for you and other interested amateur service licensees to develop the joint plan."

The League maintains that the disputes--involving three sticking points--are resolvable by enforcement of existing FCC regulations:

* One-way broadcasts, if they go beyond accepted norms for such transmissions on the amateur bands, are illegal;

* Third-party traffic, which is allowed *only* when a formal agreement exists between countries;

* Malicious interference, which is illegal always.

THREATS BRING AMATEUR'S ARREST

On August 2, FBI agents assisted by FCC investigators arrested Anthony V. Marcantonio, KA2ZGE, of Queens, NY, and seized 20 pieces of his radio transmitting equipment. FCC earlier had responded to complaints that Marcantonio was "interfering with amateur radio communications by transmitting unidentified, disruptive signals on the two-meter amateur radio band," according to the FCC.

"On July 27, FCC investigators, using direction finding equipment, traced the signal to the Marcantonio home," FCC said. "The investigators discussed the situation with a family member who then shut the transmitter off. The transmissions resumed that evening and continued into the next day." It was then, according to FCC, that Marcantonio made death threats over the radio against an FCC investigator.

Marcantonio was charged with making threats by radio, a felony carrying a penalty of up to five years in prison, a $250,000 fine, or both. A federal judge set Marcantonio's bond at $50,000 following a hearing. (FCC public notice, Aug. 14, 1990.)

CANCER CLUSTER DISCOUNTED

The state of Connecticut has told residents of the town of Guilford they have ruled out that there is a higher than expected rate of cancer in the town. The state conducted the survey after an article in *The New Yorker* last month suggested that a large number of cancers in a particular neighborhood were related to a nearby Connecticut Light and Power substation (*Letter*, July 13).

"Given the findings," said Sandy Geschwind, an epidemiologist with the Connecticut Department of Health Services, "it appears very unlikely that EMFS (electromagnetic forces) are related to the meningiomas on Meadow Street" (in Guilford).

The state's conclusion was based in large part on the fact that abnormal numbers of cancers were not found around other electrical substations.

THE ARRL LETTER - Volume 9, Number 17 - August 24, 1990 - PART 2 OF 3

FOUNDATION NAMES SCHOLARSHIP WINNERS

On Aug. 9 the Foundation for Amateur Radio announced the 1990 winners of the 33 scholarships it administers. They are:

John W. Gore Memorial Scholarship to Stuart Rosner, WU4L, Vienna, VA;

Richard G. Chichester Memorial Scholarship to Michael King, KA8NAJ, Canton, OH;

Edwin S. Van Deusen Memorial Scholarship to Martin Gruen, KA2VLD, Runnemede, NJ;

QCWA Memorial Scholarships to William T. Baggett, AA5DF, New Braunfels, TX; Thomas W. Brown, KA2UGQ, Berkeley Heights, NJ; Victoria L. Gruen, KA2VHR, Runnemede, NJ; and Paul W. Hoffman, NK3M, Sinking Spring, PA;

QCWA Leo Meyerson Family Living Scholarship to Robert M. Popella, KA3HIE, Tidioute, PA;

QCWA Robert S. Cresap Memorial Scholarship to Jason G. Lovett, N1EJD, Kennebunk, ME;

QCWA Cresson F. Donbar Scholarship to Heather L. Ludtke, KD0RU, Glenwood Springs, CO;

Radio Club of America Scholarships to Douglas Claprood, KA2KWB, Mt. Morris, NY; Timothy Potocki, N3CZV, Bradfordwoods, PA; and Jonathan Vidal, NY3Z, Erie, PA;

Edmund B. Redington Memorial Scholarship to Richard T. De La Hunt, KA0LEE, Park Rapids, MN;

Young Ladies' Radio League Scholarship to Melissa Benish, N3FAC, Pittston, PA;

Amateur Radio News Service Scholarships to Jennifer Doerrie, KA5WMJ, Booker, TX; and Paul C. Yoder, KA3MUD, Bridgeport, PA;

Columbia Amateur Radio Association Scholarship to Kurt W. Rupprecht, N3EOI, Salisbury, MD;

Baltimore Amateur Radio Club Scholarships to Barry Bell, KA3PRE, Reisterstown, MD; Andrew S. Faiola, N3GLA, Silver Spring, MD; and David S. Katz, N3DKV, Bowie, MD;

Dade Radio Club Tropical Hamboree Scholarships to Aaron A. Algiere, KC4NGA, Gainesville, FL; and Nathaniel Tarbox, KC4AOI, Jacksonville Beach, FL;

Rose Ellen Bills Memorial Scholarship to Douglas M. Benish, N3CXB, Pittston, PA;

Victor C. Clark Memorial Scholarship, Sponsored by the Vienna Wireless Society, to William T. Free, KC3YO, Fairfax, VA;

Frederick Amateur Radio Club Scholarship to Amos D. Faux-Burhans, KS3O, Thurmont, MD;

10-10 International Net Scholarships to Mark Horwath, KA1SPU, Derry, NH; and Nathan S. Willingham, KA0UFO, Bevier, MO;

WARAC Memorial Scholarships, sponsored by the West Allis (WI) Radio Amateur Club, to Douglas Kleemann, KA9LWN, Shawano, WI; Chad Kurszewski, WE9V, Greenfield, WI; and Martin Van Der Burgt, KA9MSR, Kaukauna, WI;

Kevin Barry Perdue Memorial Scholarship, sponsored by Kay (KC3LM) and Carter (KD3AO) Craigie, to Matthew M. Harbur, KB2GHW, Woodstock, NY;

Karl R. Medrow Memorial Scholarship, sponsored by the Goddard Amateur Radio Club, to Lesley D. Walker, N4FTJ, Cullman, AL.

These scholarships were open to all radio amateurs meeting the qualifications and residence requirements of the various sponsors. The Foundation is a non-profit organization representing fifty clubs in Maryland, the District of Columbia and Northern Virginia. It is devoted exclusively to the scientific, literary and educational pursuits that advance the purpose of the Amateur Radio Service.

420 MHZ RESTRICTIONS EMPHASIZED

Amateurs in New Mexico and western Texas using the 420-450 MHz band have been asked by the Department of Defense to step up efforts to avoid interference to the White Sands Missile Range. Amateurs in the area already are restricted to 50 watts PEP, on a secondary, non-interference basis, within the White Sands Restricted Area.

DOD area frequency coordinator Stanley F. Greene, in an Aug. 6 letter to selected amateurs, said that "additional coordination appears necessary to overcome conflicts in this band. In the 420-430 portion of this band, increased amateur repeater control activity and the possibility of mobile operations, are a concern as sources of interference to White Sands Missile Range operations. Amateur mobile and repeater operations in the 430-450 portion, are a continuing concern to Fort Bliss range operations.

"The US Air Force," the letter continued, "...recently asked the FCC to add an additional rule for the White Sands Restricted Area. This would require amateur operators to coordinate any operations in the 420-430 MHz band with the White Sands DOD AFC before operating there. We understand that this request has been approved by the FCC, in principle, and will be incorporated in the future."

The letter asks "that mobile or repeater operations in the 420-430 MHz band not be performed in the White Sands Restricted Area unless first coordinated with this office. The intent of the restrictions and coordination requests placed on amateurs in this area is to prevent interference on some frequencies while allowing your general use of the band to continue. Your cooperation in this effort to prevent radio interference to area DOD missions is appreciated."

THE ARRL LETTER - Volume 9, Number 17 - August 24, 1990 - PART 3 OF 3

BRIEFS

* AMSAT has announced that the 1990 AMSAT Space Symposium will be held at NASA's Johnson Space Center Visitor's Center in Houston on Oct. 19-21, and will be hosted by the Johnson Space Center Amateur Radio Club (W5RRR). The symposium will feature talks on amateur space communications and related subjects, including the new Microsats. Additional talks are tentatively scheduled on the SAREX Shuttle flight STS-35. For more information write AMSAT or phone them at 301-589-6062.

* October *QST* will announce new awards for November Sweepstakes participants. Make 100 or more contacts on either CW 'or 'phone, send two dollars and an SASE along with your SS entry, and you'll get a special pin in return. The pins will be dated each year, making them unique.

The SS announcement also will contain new specified band segments for slow speed CW (up to 13 wpm).

* Urban search and rescue operations will be featured on a nationwide teleconference to air Aug. 29 over the Federal Emergency Management Agency's (FEMA) Emergency Education Network (EENET). The telecast, from 11 a.m. to 3:30 p.m. EDT, will focus on earthquakes. EENET can be reached with a C-band antenna or satellite dish. Satellite information is: Spacenet I, Transponder 2, Channel 3, downlink frequency 3760 MHz, audio frequency 6.2/6.8 MHz. Spacenet I is located over the equator at 120 degrees west. For more information call EENET at 301-447-1068.

* On July 26 the U.S. Department of State announced that the United States government has recognized the Republic of Yemen, formed by the union of the former Yemen Arab Republic and the People's Democratic Republic of Yemen. The names to be used for this nation are Yemen (short form) and Republic of Yemem (long). ARRL's DXCC branch has asked that NO QSLs be submitted for either the former or current Yemen(s) until DXCC status of the new country is determined.

* The FCC is allowing little time for comments on its proposal (PR Docket 90-356) to relax Morse testing of disabled persons (*Letter,* Aug. 10, 1990). Deadline for comments is September 24 and for reply comments Oct. 9. The notice says "Extensions of time are not contemplated."

* As of the August 10 deadline, nominating petitions for the ARRL board of directors received (and still subject to certification of eligibility, etc.) include:

Central Division: director, W9PRN; vice director, K9EN, W9CJW, K9KM; Hudson: director, WB2EZG, WA2DHF; vice director, WB2VUK; New England: director, K1KI; vice director, WB1BRE; Northwestern: director, W7QGP, W7QMU; vice director, NM7N; Roanoke: director, N4MM; vice director, WD4HLZ; Rocky Mountain: director, AG0X; vice director, K0PGM, WB5YYX; Southwestern: director, WA6WZO; vice director, N6NB; West Gulf: director, W5SOQ, N5TC; vice director, KV5X.

In the Central division, Robert H. Lieberman, WA9JWN, was nominated for director but was found ineligible because of a lapse in membership.

* Oleg goes home! On Aug. 15 Oleg Murugov, UA4FAY, injured in a May auto accident, finally went home from the hospital in Ryazan, RFSFR. Murugov, recovering from severe injuries, has been aided by effort of a number of American amateurs (see the *Letter*, June 15 and 29, 1990). Of gravest concern was brain injury; Murugov initially was in a coma. Soviet physicians received advice and encouragement from several American medical specialists during his first few weeks of hospitalization.

(Oleg) "is much stronger and can shake hands," said his friend Igor, of club station UZ4FWO, "although the right side is still partially paralyzed. He walks with the help of one person and can feed himself with his left hand."

My guess is that (1) converting to FM would be super expensive for airlines
and general aviation aircraft owners and (2) the taxpayers won't foot the bill
for the jillions it would cost to change all the ground stations.

When aircraft started using VHF radios, they were using
already AM on the HF Aero bands so it was the obvious choice.
Even hams were using AM on VHF at that time. VHF/FM came a
few years later. Much later all HF aeronautical traffic switched
to SSB while VHF stayed to AM. There are still some AM aero voice
circuits in operation on HF.

I perhaps erroneously assumed that most hams had, when young, played with telephone parts and improvised their own neighborhood systems. Connecting mikes, earphones and batteries in series is a fun and educational cub-scout project. Add an amplifier, and it's a bugging device! :-)   DON'T connect it to Ma Bell-- It works, but the outgoing audio is very weak because of impedance mismatch.

The abovementioned audio-feedback oscillator might work as a "real" phone ringer if capacitively coupled, but TPC (The Phone Co. (tm)) et al would surely disapprove.

I have often offered various bits of ham software on this forum. I usually offer the software in exchange for a disc and SASE. I have had very few takers. Sometimes some cocky soul upon seeing my offer of disc copying asks if he can ftp it from somewhere. When I reply that I do not have the facilities to upload, but if they send me an SASE etc, they can then do the community a favour and upload to the host of their choice I always hear nothing more. I wonder why? Did they really need the software or were they just bored and wanted to add more useless bits to the pile.

Anyhow, I have always considered that mailing disks a pretty efficient way of distributing software if you are not in a tearing hurry. If you are in a tearing hurry, there are various BBS that carry all sorts of ham stuff. W3FFV and N8EMR are two who are correspondents to this forum and have extensive files.

If you want various ham and packet software by mail, TAPR has a pretty good selection for silly rates like $2.00 per disk. For Satellite users, AMSAT has lotsa stuff. Of course the AMSAT stuff tends to be theirs alone so you have to pay more for it, but it is value for money and pays for more stuff in the heavens.

There is I believe an AMSAT BBS, besides the Celestial BBS that Kelso seems to be the master of.

So what this tiresome ramble is heading to is that fact that there are tons of places and ways to get ham software. I haven't even touched on the person to person frisbee-lan. If you have something wonderful for the community, many BBS would be happy to carry it.

This is not a flame, just mumbling about software distribution.

>would it be considered remote control?
>
  Yeh, I've thought about this kind of selective call scheme before,
  but I believe it is *strictly speaking* illegal. The question that
  must be answered in such a case is "who or what is controlling
  the station?" Since nobody is presumably home all the time, there
  is no control operator there. The next possibility is that the
  station is under "automatic control" but this is allowed only for
  repeater stations. (I suppose there is some contrived way to define
  the station as a repeater???) Finally, the person making the selective
  call could be the controlling station, implying an "auxiliary control
  link" which would be illegal on 2M (but legit on 440).

Richard Hyde asks:

> Another quick question... Exactly which punctuation and prosigns do I need to know for the code test?? "Tune in the World" has NO description of the Morse Code in a character <-> pattern list !? Neither do the other popular Novice or Technician manuals I've purchased. I finally used the Encyclopedia Britannica as a reference.

I've heard and believe that if you study a "character <-> pattern" list you will never get very fast at morse. But I still wanted one. So I created a "character <-> sound" list instead. DO NOT memorize which letter has a "dit" and which has a "dah", memorize the sound of the letters. Listen to those tapes! Don't use a list.

Just for fun, in a permutation of 4 bits you get 30 possible patterns. As there are only 26 letters in the alphabet, what four patterns are never used?

E	dit	
I	didit	
S	dididit	
U	dididah	
H	didididit	
V	didididah	
F	dididahdit	
	dididahdah	

A	didah	
R	didahdit	r -prosign recieve/roger
W	didahdah	
L	didahdidit	
	didahdidah	
P	didahdahdit	
J	didahdahdah	

T	dah	
N	dahdit	
D	dahdidit	
K	dahdidah	k -prosign clear/over
B	dahdididit	
X	dahdididah	
C	dahdidahdit	
Y	dahdidahdah	

M	dahdah	
G	dahdahdit	
O	dahdahdah	
Z	dahdahdidit	
Q	dahdahdidah	
	dahdahdahdit	
	dahdahdahdah	

Numbers have 5 bits, they sound different.

1	didahdahdahdah
2	dididahdahdah
3	didididahdah
4	dididididah
5	dididididit
6	dahdididididit
7	dahdahdididit
8	dahdahdahdidit
9	dahdahdahdahdit
0	dahdahdahdahdah

Punctuation

+	didahdidahdit	ar
.	didahdidahdidah	aaa
?	dididahdahdidit	imi
,	dahdahdididahdah	mim
=	dahdidididah	bt
-	dahdididididah	du
/	dahdididahdit	dn

Who remembers which ham magazine printed an article on using hardware cloth
for forming small chasses (chassises??)? And when?

I hope nobody says, "I'll bite." because I don't remember either, but I tried
it for something or other and it worked.

...problems with learning code from practice tapes deleted....

I've learned that by rewinding the tape even though I now know what it says, it enforces the correct sounds in my brain. That is, I may have made a mistake or three, but now that I know the correct sound and the correct letter corrresponding with that sound, I can reinforce the correct relationship by going through the excersize of rewinding listening and repeating.

Its kind of like Pavlov's dog in a way. Conditioned response. Let your subconscious remember for you.

Computer modelling of HF antennas is certainly not an exact science.
Agreement within 1 db by prediction programs is certainly better than
any agreement you would get by actually measuring the antenna at real
sites.

Language chauvinist! :-)
If a program gives results in a reasonable amount of time, and the algorithm
is properly implemented, who cares what language was used.

>

If I were an antenna manufacturer, I wouldn't depend on a computer simulation
to design my antennas. Real range data is much more valuable.

I have a question: If novices were required to use crystals to generate the xmit freq, and assuming that you don't have a really big selection of frequencys (i.e. crystals), then how would you go about answering a CQ? If you are not on the same freq, then how would you expect the other guy to hear you? Keep answering, and wait for the other guy to eventually tune his radio and stumble on your answer? Seems that would take a long time before you connect. Or was there an agreed on contact frequency, that everyone would buy crystals for? Then you tell each other what freqs you have xtals for, and move there? Is 3.579545Mhz in the novice band? (I don't have the allocations memorized or handy). That freq would be a very common crystal, as it is the color TV color info subcarrier. If it is, then that might be a contact freq.

I have a 530s Kenwood and was curious to know if there are any
modifications or accessories availible to receive ~118-174 MHZ
off of the "AUX" position. Homebrew is fine.
Thanks

Tried to email twice; I think it should have gone; Oh well I'll post
so OE1CDS can get some of your comments on my comments. (Time to
debug mail again.)

In article <246@eliza.edvvie.at> OE1CDS writes:
>Has anyone experience with the ICOM IC-735? I am new lis and want to
>buy a shortwave transceiver. Other alternatives would be the FT-757, or
>the TS-440.
>
>tnx es 73
>oe1cds
>--
>This does not reflect the   | Christian Dworak
>opinions of my employer.    | USENET: dworak@edvvie.at
>I am busy enough by talking |
>about my own ...            | EDVG  Vienna/Europe - Tel (+43 222) 59907 238

I recently bought a TS-440/S with the auto antenna tuner.  I also considered
the ICOM IC-735 and the FT-757.  I thought the 440 was better than those
two.  I really wanted to get either the FT-757 or one of the ICOMs (735 or
```

725/726) but felt that the kenwood had more features:

100 memories (I use memories alot; I've already used 10 which is the alotment you get on the yaesu);

RIT/XIT display (the others have RIT but no display;
I didn't like the way ICOMs RIT worked, same goes for the CLARifier on the yaesu); (Do the ICOMS have SPLIT operation? Does the RIT vary more than 1 or 1.5 khz? RIT would be useful for SPLIT if it varies enough. The 440 does SPLIT using 2 vfos. Its not possible to work SPLIT [with freqs more that 1.2 khz apart] just using RIT with the 440.)

The 735's controls for mic gain/VOX control were under the little front panel door which I found difficult to get too;

However, the 440 has the vox controls on the rear, which is not good, it is o.k. because I don't use VOX that much;

I wanted 10 hz freq readout which you get on the 440 after snipping a diode;

I think ICOM has this but was told that the yaesu doesn't;

When changing modes on the yaesu you have to cycle through usb->lsb->cw->am->fm->back to usb....which means if you want to go from cw to usb you have to go through fm which generates alot of noise in the speaker;

The tuning feel of the yaesu and the ICOM is better than the kenwood; sometimes I think the kenwood does not have enough revolutions per kilohertz; what I mean is that for a very small change in the dial you get a change of about 200 to 300 khz. I know of no way to change this. On the Icom and yaesu when you turn the dial slowly it only changes about 50 to 100 khz.

With the 440 you can get a 1.8 khz wide SSB filter which I find essential for working 20 meters. I don't think this is available on yaesu or the ICOM 735/725/726.

The kenwood has AFSK ports which I use for RTTY, AMTOR, and PACKET.
I think that you have to use the microphone jack on the ICOM; the yaesu may have an AFSK port, I am not sure.

Of course the 440 is about US$ 100 more than the ICOM or yaesu. The auto antenna tuner is another $200.

I had a small problem with my 440: It made a very faint clicking noise when turning the main tuning knob. It turned out that the optical encoder had a small mechanical problem with it. Kenwood is sending me a new optical encoder at no charge, but in the meantime I was able to fix the instlled one.

There is a new radio from ten-tec called the Delta-II. It is a 100 watt (maybe 150 or 200 watts, I don't recall) HF transceiver with 100khz to

30 mhz receive. I don't know what the price is but I think it should be around US$1000. The nice feature about it is that it has a countinously variable width filter. I think this is a good feature in a $1000 radio. I wish I had it in the kenwood. The Delta-II is supposed to be available in november. If the price was right and available today, I might get one.

jim.grubs@w8grt.fidonet.org (Jim Grubs) comments:

(this bit originally from me)-

> I heard it again today, centered on 21005, and this time it was more radar-like, with bursts of what sounded very like our old friend the Woodpecker. It was S9+. Obvious guess is that it could be US radar, and a more obvious guess is that they will not turn if off for the hams...

Maybe this is the Iraqi radar refered to in Wednesday's Page 1A USA Today article about the CIA's prediction of imminent Iraqi military action in late July.

Aha! Please tell us more, Jim (e-mail if you think everyone else reads USA Today). If it's the YI's radar, then they certainly won't turn it off for our contests :-)   [Perhaps they would move it to 14313 though]

Is everybody ready for this? This morning on the commute to work, I listened to another operator complaining that his PLL LOCK indicator on his 2M base rig kept going on.

To mean that means a problem, but this guy is 'sure' it is to prevent unauthorized transmissions outside of the HAM bands. He is going to attempt to go in and disable this circuit.

To me that is like "Hey Gomer, I have this oil light on my dash that keeps going on! Ok, BOB, No problem, we'll just unhook the light!"

Am I missing something here???

I would have joined the roundtable and asked, but this guy already hates my guts. I seem to have disagreed with him at some time! It's all but made me stay off the club repeater I used to belong to, what with his assinine comments, unknown jamming, and even a "No Lids" sing with my call written on it posted at the club sponsered field-day setup. (This '*' is a club VP, and ran the field day setup. If you weren't one of his 'buddies' you couldn't even get into the trailer at field day!)

Maybe it's best to just let the '*' screw up his radio! I mean, he knows all! He's an 'extra'!

Actually, it's simpler than that. Safety. If you have two AM radios on the same frequency, they'll garble each other. FM is more likely to simply have one station override the other and make it disappear. If a plane is in trouble and has a weakened radio transmission, it's possible that if they were using FM nobody would hear them, but AM they'd cause enough interference that the ground would know to clear the channel and listen for them.

I don't remember this specific technique, but I bet that if someone has a copy of "Hints and Kinks" from the 1950's it'll probably be in there! I have a copy somewhere in the attic, but I don't believe I can readily find it.

Some of the construction techniques suggested in that book are truly bizarre by today's standards. It is also interesting to note that during the 1950's only three or four amateurs were responsible for most of the "hints and kinks" which appeared in QST and in a similar fashion appeared in Popular Electronics or Radio-Electronics. At the time, I often wondered if that was their sole purpose in life. :-)

How about this for an example: Turn an old toothbrush into a dial cord stringing tool by cutting off the bristles and filing down the end? I'm *serious*!

One name even comes to mind, who was probably the No. 1 originator of Hints and Kinks material: Art Trauffer. Does that name (or something like it) sound familiar to anyone?

> OK - LET'S MAKE A rec.ham-radio.binaries !!

How about rec.ham-radio.software -- I think that would be more appropriate, because it would encompass sources, as well. I already have a nice handfull of things to post, including a moonphase prediction program, the famous MORSE 2.x tutor, and SEESAT - two of those are C sources, one is a binary.

I *SUPPOSE* that rec.radio.software would be acceptable, too, because much of this stuff is of interest to SWL'ers, too -- my problem with this is that it makes a lot of things much more convenient to have a single rec.ham-radio heirarchy, and so the best option would be to move rec.ham-radio into rec.radio.ham (or something like that).

My $0.02 Hope you got my money's worth :-)

Best 73's,

For the past few months I've been reading ham-radio in the hope that soneone out there could give us some info on this AEA ISOLOOP antenna. But, no luck. I've heard people on 2m here in Chicago discussing the Isoloop - of course, no one had one but everyone wondered how/if it worked. I've heard people say flat out - "It can't work".

Well, I bought one and have been using it for a week or so. I should say that I was "forced" to buy one - I'm an apt. dweller, and, having experimeted with various things found that I probably didn't have a choice. My 45 ft multi-band dipole worked ok - but was aesthetically displeasing.

Parts is Parts. . .

The Isoloop is made of aluminum and comes in two pieces which need to be joined together via some connectors. That's all there was too it. Early units did NOT come with any control cable (the review in CQ mentions this). My box came complete with 50ft of control cable, the control box and a small wall-plug power supply (only included in USA versions). Basically, its complete including hardware for mounting on a mast either in the vertical or horizontal direction. All one needs to supply are "externals" such as coax, a mast for mounting and possibly a tripod. I already had all of the above.

Its too small... it CANT work. . .

Does it work? Well, amazingly it does. How well? Read the review in the recent issue of 73 comparing the Isoloop to the R5 and a full-size attic dipole. All I can offer is my qualitative experience (after a week of use).

First, I prefer to use the Isoloop in the vertical rather than horizontal position. The horizontal position gives an omnidirectional pattern. The vertical gives a directive pattern with the gain of a dipole. I have my Isoloop mounted vertically with the plane of the loop pointing East-West. This produces nulls in the North-South direction. One afternoon I worked a number of stations on 10m mostly in California (from Chicago) using both FM (40 watts) and SSB (100 watts) and got good signal reports on all contacts. The propagation conditions were just average and it was mid afternoon. A few days latter in the evening I worked most states on the West-East line from Chicago on 10m and 20m. All my contacts have been stateside so far. (1 week)

Beggars can't be choosers. . .

Tuning this thing via the stepper motor is another matter. In switching bands (say, 10m-20m) it takes about 20 seconds to get to the general vicinity of resonance. Past this, at least for transmitting, it takes another 10 sec or so to fine tune to minimum SWR. That may not sound like alot but its not exactly "tune and talk" as if you had a R5 or tuned diople. But, it will get you through the night.

Use. . . and observations thereby. . .

All contacts mentioned above was with the Isoloop indoors, in a wood frame house, on the 3rd floor about 35ft up from mother earth. Even with the Isoloop not in "free space" (I have it in the corner of a room) I can get a 1.4:1 SWR or less on almost all bands (14Mhz-29Mhz). I even tried with the Isoloop in a closet - that works too. I'm working on passing this thing off as an "art object" to my non-ham friends. (A bit easier with my 2m/440 discone)

A better place for the Isoloop would be hanging it out a window. Its small size fits easily through a window. Its very light and support is not a problem. Mounting brackets on the Isoloop would allow both horix. or vert. mounting. I'll try this in a week or so.

I like the fact that this antenna is directive. And, indoors on a tripod I can easily turn it to whatever direction to get the best reception/signal-reports. This is something you couldn't do with a diople. There is no directivity with a R5 so running barefoot as I do (100 watts) this gain/directivity is an advantage. An obvious "next step" would be to add a remote antenna rotor to the Isoloop/tripod. That would be a great.

Some improvements I'd like to see. . .

A few things could make this thing easier to use. First, as regards "accessories" that could be provided.... how about automatic tuning based on the same principles used by automatic antenna tuners internal to some transcievers (TS-440). Since the motor control circuit is already there is shouldn't be too hard to hack additional electronics to monitor SWR on low power transmit and tune accordingly. If I can't have that... how about just a simple feedback mechanism to tell me where the position of the tuning capacitor is. Once I have the Isoloop in a "fixed" position I would assume that resonance for a particular freq. would always occur at the same place. Why not tell me where that is via some digital readout so I don't have to keep hunting this down every time I want to go there?

Conclusions. . .

I like the Isoloop alot. In fact, I think its the *only* solution to the problem of not being able to put up a beam, full-size dipoles or vertical for HF work. This problem is probably faced by all apt dwellers to some extent. Price? AES has it for $349 mail order and no tax if you are outside Wisc. I've seen it for just under $300 in QST - but they might be earlier units without the control cables - check if you're going to buy one.

I will continue to experiment with my Isoloop. I wish QST would do a review of this thing. The CQ review was really really poor in quality; the 73 review was a bit better. I think QST could do a good job based on the quality and depth I've seen in their product reviews.

Your guideline sounds about right. Better safe than sorry! In addition the mail to many third world countries is very "unsafe", "green stamps" as well as IRCs often simply dissapear.

I found that the most releable way to "beat the crooks" was to make the letter look as much as possible like a personal note. Including colored envelopes, perfume (in one extreme case) and hand lettered addressing using the local spellings for place names. I would only go to this trouble if I suspected a problem or on a follow up QSL, but very few of these ever got lost.

I recommend one of the DXers "phrase books" too. Something as simple as "thanks for an enjoyable QSO" in the local language can work wonders on turn around time!

I HOPE that no one actually cashes in any IRCs! Most DXers have a very active market for them. If you want to buy some then send along a request to one the big time QSL managers. Usually they go for around half the selling price (about 60 cents each now?)

80% of DXing is getting the QSL!

sawyer@twg.com (Bruce B. Sawyer), in an admittedly biassed and inflammatory posting (G'day Bruce!) suggests:

Let me get this straight.
(a) You and AA5ME heard it for many hours in the afternoon.
(b) Nobody else but Rick did because they are too busy with {set of worthless pursuits}.
Hmmmm. Let me suggest one other possible explanation for the lack of response.

--> Contrary to the gospel of KA9Q, there do exist cw ops (usually called "olde fartes" in these parts) who have not yet racked up the advanced number of years needed to gain admission to the society of OLDE FARTES and thereby partake of the benefits to which they are and should be entitled by virtue of having made this country great, etc., etc.: Social Security. In other words, we work.

What, Saturday afternoons and Sunday afternoons every weekend? You never get on the air ever? And nor does anyone else on the net? Gad, what a *senseless* waste of human life!

Admittedly I'm just a perfessa and so I can stop by the club shack on the way to or from classes, and AA5ME is a lazy time-wasting gynaecologist who can take time off from doing baby things to work DX, but I did mention that this stuff was loud and clear during the (phone) contest at the weekend, which means Sat and Sun to most people.

And I'm not a Real Olde Pharte, I'm a Middle-Aged Pharte at least two solar cycles away from collecting Social Security. And I can't claim to have made this country great [sic] cos I'm not even an Amurrikan. I would just like to be able to use the frequencies that the Great and Glorious FCC gives us.

Flames welcome (they're more interesting than a lot of the postings on this net!), but best directed at 45 deg to whoever is making these naughty noises in the amachure bands.

A couple of years ago I bought a Swan 500C at a hamfest. It has been sitting on my desk since then, unused due to my lack of low band antennae, my fear of blowing it up (I've never tuned up an HF rig) and my abundant stock of other distractions.

Having never been on a band below 144 MHz, I'd now like to give the low bands a try now.. or should I say "the low band" I'm a tech and hence am restricted to SSB on 10 meters for now.

Questions:

1) I need to buy or build (probably build as I have to skills or facilitites for metal work.) a 10 meter antenna. I live in an apartment house, and since my landlord has overlooked my 2mtr & 440 vertical antennas mounted on TV masts on the roof, I figure that another vertical would probably be the safest thing to try. I considered a dipole, but don't want to experiment with seeing what sort of reaction I would get to an antnna involving wires extended over the roof. The only commercial antenna I've noted which seems appropriate is the 10 meter Ringo. Opinions about that antenna.. or suggestions of others? I should also mention that I am on a rather tight budget. I left the real world last year to become the proverbial "poor grad student" and as such will not be able to implement suggestions involving $200 arrays.

2) I could use some instructions on how to tune up my Swan 500C and B&W VS300A antenna tuner without causing damage to the rig or myself!

73,
Gerry

They could use this shortcut for ALL upgrades and really cut the paperwork.

I am opposed to this because it does not provide the proper information as readily. The FCC also has to be in a position to re-issue lost CSCE's.

Finally, why put upon one particular class of licensees to keep saying "interim whatever" forever? Silly, annoying, and would cause some people to become inactive.

And doing it to the TECH class privilege set is a BAD CHOICE. Unless the Communicator class grants ALL privileges above 30 Mhz (with NO exceptions whatsoever) then there will be a great need to have that "class" available.

If the FCC did adopt it, I would be writing to my congress critters and complaining that a federal agency is usurping their duty under the Communications Act and that this is no way for such an agency to act.

Back last fall, I talked with a rep from Bull and asked about

Heathkit. What follows is the gist of our conversation.
I DON'T KNOW IF ANY OF THIS IS TRUE ... TAKE WITH GRAIN OF SALT.

He said that Zenith had acquired Heathkit as an "easy" way of getting into the computer business, since it had previously been almost entirely into consumer electronics (tv's, etc). Course this turned out not to be such a good move since Z never captured a major share of the market. After HK was bought by Bull, the word was that the divison was not going to be supported at anything beyond a minimum level. The reason for this was that a study had been done about 10 years ago which projected that in the future (ie, now), work would have become so automated that leisure time would have increased by 40%. Thus the kit market was expected to boom. However, this study hadn't taken new technology developments into account (difficult predicting the future, especially in electronics), and hadn't realized the impact of VCR's and PC's. What has actually happened is that leisure time has DECREASED from what it was 10 - 15 years ago, so no one has time to build kits anymore. Thus the direction of Heathkit was going to be away from "hobby" applications and towards education/training. And in fact, I just got a Heathkit educational division catalog yesterday.

I too am very nostalgic for Heathkit. My first amateur rig was an HW-16 code only rig. Was a big deal when the regs changed from being rockbound to being able to use a VFO. I immediately bought the VFO (was it $75?), and had great fun since I COULD ACTUALLY TRANSMIT ON THE SAME FREQ AS THE OTHER GUY WAS SENDING! WOW!

I also built (about 1968) the Heathkit BOONIE BIKE, which was, believe it or not, a kit motorcycle. The major claim to fame was a rear tire that was about 8 inches wide (might have been a foot) which supposedly acted as a flotation device so you could zip through mud and so forth where standard tires would sink in. This was somewhat correct. The bike would stand upright on it's (wide back) tires without even a kickstand. It had a centrufigal clutch which gave a lot of trouble, though. B & S engine, also, as I remember.

Anyway, I hope that Heathkit is picked up by a company that will find a way to keep the company going and make a profit. I still do buy stuff from them, although not usually not kits. Most recently I bought one of their "house sitters", a unit which monitors temperature, power, etc and dials you up if parameters go out of bound. I use it at a cabin which I only get to occasionally.

Anyone else have old Heathkit nostalgia?

Mike: I trust that you realize that many countries require as many
as 5 IRCs to return your QSL Air Mail. My experience has been that
enclosing one IRC results in no QSL received, and also that surface
mail seems far less dependable from some areas of the World than others.

Don't take chances: when you DO use IRCs, use the number listed in
the Callbook for the specific country, and send a self-addressed
Air Mail envelope!

Hi. I just got a FT-811 Uhf handheld that I want to use to debug
420 Mhz full duplex links for a repeater I'm building. I have the
mod that is supposted to do this but it does not work properly.
I can xmit on 420 but the receiver is completely numb on all
frequencies! Backing out the mod restores it back to normal.
I appear to possibly have a newer version of this radio as the
serial number looks like it might have been turned (mine is
9N120004). The mod I used removed jumbers from postions 2 and 4.
A new jumper was added to position 3 making the only jumpers
connected to positions 3 and 7.

Can anyone help me with this? I couldn't care less about rx or
tx outside the ham bands just 420 to 450 Mhz is all I need.

HELP!!!!

****

A while back there were several posts about a new positioning system
that was planed / in operation for the 902 band, The jist of the posts
was that amateur use was secondary, and that it would trash any 902 band
plan.   As I recall it was already in use in S. CA. and comming soon to

the rest of us.

Can anyone point me to the FCC rules covering it.
Any details on the system design and any "specs", would be appreciated.

```

Is there any advantage over putting the program in the already existing
appropriate group and announcing it in rec.ham-radio?

Here are some reasons not to have a ham-binary group:

```
     Binary for what computer? the first thing we would have to do
     is split it into ham.binary.amiga, .cpm, .c64, .ibm, abi-sparc,
     .abi-moto, .abi-intel, .mac, etc etc etc

     Hams like to play with things and adapt them, right? give us
     source!
     Having ham programs show up occasionally in the computer groups
     helps give the hobby more exposure.  XXX computer owner says to
     himself "Looks like a lot of people use XXX for ham radio....
     I should check it out."

It wouldn't work at audible baud rates, but back in the 45.5 baud Baudot days in Air Force MARS, there was a repeater at Hanscom AFB, MA, which did both simulataneously. RATT (as the military call it) had a separate input frequency and produced direct FSK of the repeater carrier. To voice users, it sounded like a dead carrier and each type of user operated without QRM from the other.

Because even 300 baud packet would be audible, that old system wouldn't work but maybe some more sophisticated form of multiplex would.

Any noise bridge circuit will work, except that you don't need variable bridge legs. Select the values that balance the bridge at 50 + 0j.

Maybe this is the Iraqi radar refered to in Wednesday's Page 1A USA Today article about the CIA's prediction of imminent Iraqi military action in late July.

It is important to stop the discharge of a battery pack when its terminal voltage reaches about 1 V per cell, to prevent any given internal cell from going to zero volts. The damage to a cell comes when it becomes reverse biased and is reverse charged by the rest of the pack. 1 or 1.1 V is rather arbitrary, what we are looking for is the voltage below which very little charge still remains on any cell in the battery. Once any one cell reaches that voltage it is extermly easy for the stronger cells in the pack to rev bias that weak cell.

Ah .. the critical point.. if all the cells are perfectly matched this is not a problem they all die simultainiously.

If however you as many hamOAs often do..you have replaced a bad cell or 2 or have made up a pack of surplus cells, who knows when the first weak cell will die.

There is no danger in discharging an individual nicad cell to zero volts, regardless of the load as long as we stop there. If we continue to force current thru the cell it will reverse bias and liklly short. The whole "trick" is in knowing when to stop if you can only measure the battery not cell voltages.

For commercial batteries 1 V per cell seems to be a good rule of thumb. A factory made battery pack will be made from cells of the same lot which are reasonably closely matched.

For large expensive or very critical application measure every cell and stop when the voltage approaches zero on any one.!

Because your HT can't sence the right voltage to stop discharging the battery mean you will have a hard time protecting the big battery!
The mfgr set the right cut out V for the small battery. In application where multiple voltage batteries are allowed the function is best built into the battery.

Then again for commercial battery packs this only starts to be a problem as they get old, when 1 or more cells start losing capacity. Just about the time the manufactuer wants you to buy a new battery!

In answer to Karl R. Tigerstedt:

I've run into a lot of lightning damaged equipment and the bottom line is that there is nothing predictable about the kind of damage that you'll get. I've seen equipment where every active device was wiped out. The best thing is to send the equipment back to the manufacturer (IMHO)....He's probably seen it before.

All of the above, even though true, overlooks one fact - AM works. There is no compelling need to change every aviation radio in the world. If they ever drop AM, they probably skip FM and go straight to one or another digital mode.

To make sure whether or not this was a real $1000 fine, and not just a show cause order, I called the FCC office in Boston and was told this was a fine. I was afraid they were going to be able to argue their way out by writing letters, etc. and carrying on with the FCC. No such luck, boys. Pay up! Grow up! And shut up! Its about time the FCC did something.

These guys have been an international disgrace to this country for a long time.

I'm thinking of a nifty project to install when I move into my new place of residence in CA. In particular, the problem I'm trying to solve is that I'm always wanting to do some SWLing, but don't want to spend all my time in the 'shack'. What I'd like to do is to have the audio from my radio available in all rooms in the house. I can think of wanting to upgrade this later to include video, and possibly doing remote control/operation.

What I'm thinking about is using the cable TV coax in the house as a distribution medium. In particular, taking the cable TV coming from the outside, and 'add in' a few more channels, that I can use to send video/audio from my shack around the house. Then I can use TV's in any room, (even cheapo b/w jobs), to tune the sound that I want. I can think of nifty things like distributing the screen contents of a PC, (for WESAT pictures for instance), as well as more mundane video sources like a surveillance camera mounted outside, as well.

The thing I need here is a box that will mix my incoming cable signal, (which already has 30 or so channels on it), with some 'new' channels that I originate myself.

Does anyone have any experience doing this sort of thing? Know what the appropriate devices are called/cost?

Doing it this way has the advantage that I put all my funding into the front-end equipment, and virtually nothing into the receivers, (since I'd probably have TV's spread around anyway, and small ones are pretty cheap these days). It's real easy to get hamfest parts to build an 'audio-only' TV receiver as well.

Obviously, I need to solve the problem of a 'reverse channel', but I'm thinking of doing that either using carrier current technology, or by putting a single audio carrier on the coax.

Anyone with ideas, please repond to me directly, as I don't get this list reliably at the moment.
-jcp- (N3CKF)

DRAFT OF REPLY COMMENTS ON NOCODE BY BILL TYNAN W3XO. PHIL: IF I SEEM ROUGH ON YOU, IT'S MOSTLY FOR EFFECT TO GET ATTENTION. I'M NOT MAD OR ANYTHING. BUT, WE DO DISAGREE ON SOME POINTS.

73
BILL

Before the
FEDERAL COMMUNICATIONS COMMISSION
Washington, DC 20554

PR Docket No. 90-55

In the Matter of
Amendment of Part 97 of the)
Commission's Rules Concerning)
the Establishment of a Code-free)
Class of Amateur Radio License)

REPLY COMMENTS
Submitted by
William A. Tynan W3XO
HCR 5 Box 574-336
Kerrville, TX

The writer submitted comments in the above proceeding, supporting the general concept of the code-free license but urging that any codefree license support the following general objectives:

A. Encouraging responsible and knowledgeable people, particularly young people, to enter Amateur Radio.

B. Leading to an increase in the utilization of the higher frequency Amateur bands (220 MHz and above).

C. Not increasing the difficulty of entering Amateur Radio for those who might not be as knowledgeable and technically qualified as perspective code-free license candidates might be.

D. Not disrupting current valuable amateur activities.

In support of these, I included the following specific recommendations:

1. Limit codefree licensees to 220 MHz and above, as proposed in the NPRM.

2. Design the examination for the codefree license so as to determine that the applicant has a real knowledge of basic radio, electronics and digital theory, rather than having merely memorized the answers to a few questions.

3. If Number 2 can be accomplished, afford the new licensees all the privileges, in terms of power etc. as higher grade licensees on the same bands.

4. Call the new license "Experimenter" NOT "Communicator".

5. If the Commission sees fit to follow the advice of those who have recommended that codefree licensees be given privileges on 6 an/or 2 meters; institute new rules to limit 50.1 to 50.5, 144.1 to 144.5 and 145.8 to 146.0 MHz to narrowband modes such as SSB, CW and AM (same bandwidth restrictions as are in place for the HF bands), retaining the existing CW limitation from 50.0 to 50.1 and 144.0 to 144.1. (The writer believes that such a provision is needed whether or not codefree licensees are given access to 6 and 2 meters, and is presently preparing a petition for rulemaking on the matter.)

6. Retain the Novice Class license, with administration of its exams coming under the VE system. If classes must be eliminated in order to reduce the Commission's work load, eliminate the General, Advanced or Extra Classes. In any case, such action should be the subject of a separate rulemaking.

Although I have not had the opportunity to review all of the responses submitted in this proceeding (not being able to travel to Washington), I have seen a number of them forwarded to me from various electronic mail sources. I will address those that I have been able to examine.

I am aware of the comments filed by the American Radio Relay League and generally support them, especially in their reaffirmation of their recommendation that codefree license privileges begin at 220 MHz. I do not, however, support their acceptance of the name "Communicator" (their original proposal), for the reasons outlined in my comments filed on this docket. I also do not see a reason for a power limitation of 200 Watts. If the examination is comprehensive, as I have urged, there should be no valid reason to limit the power of codefree licensees to anything other than that available to higher class licensees on the same bands. If, on the other hand, the Commission determines that a comprehensive examination cannot be designed, then I submit that codefree licensees should be limited to 10 Watts. Under that eventuality, the name "Communicator" is probably appropriate.

In the comments filed by the Radio Amateur Satellite Corporation (AMSAT), they espouse the concept of a comprehensive examination that tests the applicant's real knowledge of electronics. Naturally I support their position in this facet of the proceeding. AMSAT also argues for protection of portions of the 2 meter band for weak signal, narrow band applications. I support this as well. They insist, however, that provision be made to provide access by codefree licensees to VHF bands being employed as satellite uplinks. As they point out, there are a number of ways of accomplishing this; from the waiver process, to outright granting of 2 meter privileges to codefree license holders. As stated above, I do not support granting of 2 or 6 meter privileges to codefree licensees because it defeats the objective of increasing the population of the higher frequency Amateur bands. Some kind of waiver, applicable to codefree licensee attempting to communicate through Amateur satellites, might be appropriate, however. Another approach suggested by AMSAT is to grant them blanket use of the satellite uplink frequency segments. Since there is no current way to mandate that licensed amateurs operate in the satellite sub-bands only when attempting to use satellites, I believe that this would lead to disaster in the form of terrestrial interference to satellite operations. The satellite sub-bands would be the only portions of the 2 meter band where they would be allowed to operate. While the waiver approach might carry the same difficulty, the waiver provisions could be made very specific to prevent it.

The comments of Phil Karn KA9Q, although inaccurate and incomplete, are interesting. Despite his many valuable contributions to Amateur Radio and his possession of an Extra Class license, I must conclude that Mr. Karn doesn't understand the hobby - beyond his own narrow area of interest. In his third paragraph, he state; "Code proficiency is no more relevant to operation on the 50 and 144 MHz bands than it is on the frequencies above 220 MHz". I might agree with this statement, if he means that code proficiency IS valuable on the bands above 220 MHz. But, I don't believe that this is his intended message. The entire thrust of his comments is that code is no longer needed in Amateur Radio - not just on VHF. He blames only ITU regulations for retaining a code requirement for operation on the HF bands - and there proposes to lower the requirement to 5 words per minute. I am convinced that he intends to work for the elimination of the ITU requirement, as well as any code sub-bands on HF. The tenor of his entire submission is anti-code in general, not merely pro codefree license. Mr. Karn is either unaware of, or doesn't care about the many who use code regularly on the VHF and UHF bands. Being associated with AMSAT, including being a member of its Board, he must be aware of the important role code plays in operation via the amateur satellites. Indeed, the way many get started on the satellites is through code. It provides a way to construct a simple, inexpensive station, capable of satellite operation. SSB or data communication on the satellites, usually entails the use of expensive commercial equipment. In fact; it is interesting to note that Mr. Karn, despite his close and valuable association with AMSAT, makes only passing reference to satellites. Other VHF/UHF applications of code, the existence of which Mr. Karn ignores, include long haul tropo and moonbounce communication. My long years of experience on the bands above 30 MHz have taught me that code is particularly valuable. Many of the countries I have worked on 6 meters (101 at current count), I could have only worked using code. If anything, the use of code is even more necessary on the UHF and microwave bands than on the lower VHF bands. On at least one occasion, I have been frustrated in not being able to work a low power station on 1296 MHz about 120 miles away, because his station was not set up for CW operation. I am convinced that codefree licensees will certainly be at a disadvantage on any bands they occupy, unless they are satisfied to limit their activities to relatively short haul voice and data modes, generally based on the use of FM.

I agree with Mr. Karn that codefree licensees should not be considered as some kind of non-real hams. However, I contend that the key to have them accepted as "real hams" lies in a comprehensive license exam. Mr. Karn does not even address this issue in his comments and seems satisfied with the name "Communicator". I assert that the use of the name "Communicator" and a requirement to pass only a relatively simple entry level type examination, is very liable to result in codefree licensees being branded as some kind of sub-hams.

Another, who does not appear to understand what really goes on on the bands above 50MHz is Brian Kantor. He begins his argument for granting codefree licensee use of all bands above 30 MHz with the premise "Since Morse code is rarely used in VHF and UHF communications..." Surely, basing a position on such an erroneous argument should be grounds for ignoring the remainder of his comments. Nevertheless, I will deal with some of his other points. Mr. Kantor, Mr Karn and many others base their argument for a codefree license on the premise that we should do all we can to encourage interest in scientific and technical fields, particularly among young people. I agree with this and it is one of reasons I support a codefree license. However, I would not want it to turn into a CB-like service. That would be counterproductive to meeting the objective. We might get lots of new "hams", but they would hardly be advancing scientifically or technically. My other major reason for supporting a codefree license is to promote greater occupancy of the higher bands. I contend that, if a person truly wants to get into Amateur Radio as a technical hobby and wants to do so without learning code, operation above 220 MHz and a comprehensive technical examination should not be hindrances to that objective. If, however, the objective is to "talk to their friends and family over the radio" then a simple exam and 2 meters is what they want. I submit that if this comes to pass, unless the Commission erects some kind of barrier to FM operation in the weak signal and satellite portions of the band; satellite, long haul tropo, meteor scatter and moonbounce operation will be things of the past. Mr. Karn, Mr. Kantor and many others, who seem to think that VHF/UHF operation is limited to FM and packet (also FM), ignore the impact of turning lose an additional hoard of FMers on 2 and 6 meters without some kind of protection for weak signal narrowband modes. Mr Kantor compounds his lack of knowledge by the following statement: "Even the traditional advantage of Morse for weak signal communication no longer holds true: digital signal processing techniques have yielded communication systems which can be built by the ham experimenter that will provide reliable communications at received signal strengths far below those at which the human ear can even discern that there is a Morse signal present." THIS STATEMENT IS ABSOLUTELY FALSE. Some day, it may be true. Many VHF operators hope so. There have been many promises over the years for such a utopian scheme that would make moonbounce available to the "average" VHFer (100 Watts and a 12 to 15 dB gain antenna). But, so far, no one has demonstrated such a system. The answer is that more goes on inside the human brain in digging out weak signals than most people realized. Maybe, some day, the process can be implemented on a few chips, and maybe even improved upon; but it hasn't be shown to work that well yet. I won't waste my time and that of the Commission discussing further Mr. Kantor's comments. I am happy to see that he stopped short of proposing that the Commission "ban" Morse code, although he seems to have considered the idea.

I agree with many of the points made by Mr. Kenneth J. Hendrickson N8DGN, although not necessarily with his conclusions and recommendations. I think that he is correct in noting that most technical contributions and articles about them come from amateurs with higher grade licenses. Mr. Robert J. Carpenter W3OTC has also studied this phenomenon, and reached a similar conclusion, which is documented in his comments. Nevertheless, there may be some who can make technical contributions but are inhibited from becoming amateurs by the code requirement. It is to tap these few, that I support the concept of the codefree license. However, as I have stated several times, it should not be based on a simple entry-level exam aimed at appealing mostly to those who want get an Amateur license so they can "talk on the radio". Naturally, I agree with Mr. Hendrickson's comments with regard to code being a very useful mode for weak signal conditions and under conditions where signal spreading takes place, such as auroral propagation. However, I reject his recommendation that the weak signal sub-bands should be off-limits to those who have not passed a 13 word per minute code test. Current Technician Class licensees make up a significant proportion of those active on these bands. (Although, evidence shows that they are not in majority.) I think that it would be a mistake to eject them at this point. I am even in favor of codefree licensees being able to operate the weak signal sub-bands - provided that they do so with SSB or CW (NOT FM). I believe that the more intelligent ones will soon learn that they must have a working knowledge of Morse code in order to make effective use of VHF and UHF frequencies.

Nothing I have seen in the comments of others has altered my convictions as stated in the comments I submitted on this docket. I hope and trust that the Commission will study all of the comments and reply comments, as well as carefully evaluate the ramifications of any proposed course of action on the various facets of Amateur Radio, including that not-very-vocal minority - the weak signal VHF/UHF/microwave operators. Through such a process, it should be able to come up with a decision which will benefit all of Amateur Radio without negatively impacting any group.

Respectfully submitted,

William A. Tynan
W3XO .

That QRM has been heard at this location also on anumber of occasions over the past three weeks. It has always been between 21020-21030 strongest from the north/north east. It has frequently been 20 db S9 on
my TS930s. It would be interesting to get some beam headings on the signal from various locations.

I am looking for a manual for a Lafayette Comstat 25B 11m base radio.

Please let me know if you have one and could xerox it for me. I would gladly reimburse for costs.

Go to the nearest electronics supply store (not Rat Shack) and look in the master index for SAMS Photofact CB book sreies to find the issue that the Comsat was issued in. Buy the book, if it is still in print. If not in print then find a TV shop or some other older establishment for consumer stuff repair and plead with them. That's your best bet. Otherwise, guess :-).

From a recent argument for "no-code" licenses:

> Third, the Citizens Radio Service is only one of many other services that do not require their operators and users to know Morse Code. Others include broadcasting, public and private land mobile (including police, fire, GMRS and business band radio), common carrier (e.g., cellular telephony), and aviation. All seem to get along just fine without a code requirement for their operators. Why single out CB for comparison?
>

If one wants to transmit, then the previous paragraph provides several ways to "get on the air". I encourage all would-be "hams" who don't have the willpower/time to learn this simple required skill, -- --- .-. ... .   -.-. --- -.. ., to look into one or more of the above opportunities. They all get along just fine without the code requirement. Of course, you may to have some other qualifications.

> Using much the same arguments as the proponents of a no code license have been using, a computer science graduate student recently asked me why there should be a technical exam as a license requirement. He claimed that he did not intend to build or work on radios, but he just wanted to be able to use a hand held transceiver to talk to

> people." (Alan Larson, WA6AZP)
>

Handheld transceivers for this purpose my be purchased from Radio
Shack, Service Merchandise, truck stops, etc. There are generally
AM and operate around 27 MHz. The grad student in question will
then be able "talk to people" who feel the same way he does.

I'm afraid I'm not convinced yet, but keep on trying.

My first rig was a two-tube transmiter, and a general-coverage receiver
(with amateur-band bandspread dial scales!). I only had one crystal for
the transmitter, but managed to make many contacts with my 5 Watt signal.

The method used was to listen near my transmit frequency, scanning perhaps
plus and minus 10 kHz for replys. In the "olden days", when crystal control
was still common, we often operated with a small split.

Actually, I usually didn't send CQ. There was generally enough activity
that I would sit, vulture-like, on my transmit frequency, monitoring for
anybody interesting calling CQ or finishing a QSO.

The VFO was a great invention, indeed!

> [...] Is 3.579545Mhz in the novice band? [...]
> That freq would be a very common crystal, as it is the

Yeah, its in the novice 80M band. I haven't worked 80M (ever!), but have wondered about that frequency. Just imagine the noise floor, with all those quasi-synchronised, pulse modulated color-bursts going on, nation/world-wide. I can imagine it all right, but what's it really like?

By the way, the ancient history I've just related took place circa-1975. I was on a *tight* budget then! (How come it seems even tighter now?)

Before the
Federal Communications Commission
Washington, D. C. 20554

In the matter of:)
)
Amendment of Part 97 of the   )   PR Docket 90-55
Commission's Rules Concerning   )
the Establishment of a Codeless   )
Class of Amateur Operator License   )

REPLY COMMENTS BY ROBERT J. CARPENTER, W3OTC

1. I, Robert J. Carpenter, 12708 Circle Drive, Rockville, MD 20850, having submitted Comments on this Docket, now submit these Reply Comments to correct erroneous or misleading assertions made in various other Comments on this Docket. I also wish to specifically endorse certain other Comments which appear likely to make valuable improvements in amateur radio.

NARROW-BAND-EMISSION SUBBANDS NEEDED ON VHF BANDS

2. William A. Tynan urges the Commission to establish narrow-band-emission subbands on all VHF amateur bands. I strongly support his request. He is right in saying that weak-signal experimental communication, usually using these narrow-band modes, is the chosen activity of many of the most advanced amateurs. It is endangered by encroachment from wide band operation such as FM, packet, TV, spread-spectrum, etc. It is vital that the Commission establish the subbands he proposes so that new and old amateurs will be fully aware of them. Many amateurs are either unaware of the ARRL voluntary band plans, or may be so "anti-League" as to purposely ignore them. Only Commission action can protect this important technically advanced facet of amateur radio from the wide-band operators who are unaware of the weak signal operation since their radios only respond to strong signals. Packet and digital users, not listening by ear, have no chance of noticing the narrow-band weak signals, and thus offer a large potential source of interference.

3. The Commission may wonder why it has had few complaints of serious inter-mode interference in amateur radio. The reason is clear: in the past all amateurs listened to their receivers by ear; starting with packet, we see the coming of amateur modes where no person is monitoring before transmitting.

NOVICE AND TECHNICIAN CLASSES SHOULD BE RETAINED

4. I agree with Philip Karn, Brian Kantor, William Tynan, the ARRL and others that the FCC is wrong in proposing to eliminate "lower" amateur classes such as Novice and Technician. These classes provide a valuable with-code entry point and upgrade path. In fact I feel that these entry points are more suitable than any no-code license.

RETAIN ADVANCED CLASS; PHASE OUT GENERAL AND EXTRA

5. I disagree with Philip Karn, Brian Kantor, Gordon Girton, and others, who want to phase out the Advanced Class and keep the General Class. The additional technical knowledge required for the Advanced Class is vital for full-power HF operation. I recommend that the General Class be phased out instead.

6. Philip Karn and others point out that the FCC says that it is

only able to process about 50,000 amateur licenses a year, and that the current workload approaches this quantity. It is regretable that the NPR 90-55 text did not reveal this fact, since it would have emphasized the urgency of reducing the complexity of the amateur licensing structure, and the number of incremental upgrades. In this context, the Commission should immediately stop issuing new General and Extra class licenses. They should be grandfathered forever, and separate proceedings initiated to eliminate the Extra class band segments. The Commission should also investigate transferring some or all of the data entry task to the Volunteer Examiner system, or some new form of voluntary support corps from the amateur ranks. The amateur volunteer resources are available, they just need the request and some organization.

7. People should be encouraged to enter ham radio at the highest possible license class, and thus reduce the number of unneeded upgrades, To accomplish this, the Commission should require that (1) all exams be given by Volunteer Examiners, and (2) ONLY TWO EXAM "PACKAGES" SHOULD BE OFFERED: (1) 5-WPM CODE AND THE NOVICE AND TECHNICIAN WRITTEN ELEMENTS, AND (2) 13-WPM CODE AND THE ADVANCED WRITTEN EXAM. Even if only one-third of the applicants qualified for Technician (or a no-code license) instead of Novice on the first try, there would be a major reduction in the FCC's large license upgrade workload.

8. It is wasteful paperwork for the Commission to handle certificates attesting to successful completion of insufficient exam elements to allow issuance of any class of license. How can one justify the expense of keeping a record of partial success, when it is logical to expect an applicant to retain the tested knowledge and skills at least long enough to complete all the requirements for license issuance.

9. William Tynan's arguments against adoption of the name "Communicator" for any no-code license are well-made. The Commission should emphasize the technical aspects of amateur radio, should it find that a no-code license is justifiable. A no-code license should not be a "no-code, no-thought, no-work, just-talk" license. The term "Communicator" gives precisely the wrong flavor as to the goals for a no-code license class.

10. Gordon Girton's suggestion of perpetual Technician operation with a CSCE and call-letter suffix, just seems to add to the problems. The FCC field offices would have dozens of unofficial VEC lists of Technicians to paw through, Technicians would have to submit to code reexamination or at least pay their VEC each year, and the FCC amateur data base and the Call Book would have no record of which Technicians were "current", preventing the traditional self policing of amateur radio. Really a terrible idea. Girton's other suggestions on temporary suffixes and distinctive call letters reek of "administrative neatness", and are useless as I pointed out in paragraph 20 of my original comments.

11. Brian Kantor's suggestion of allowing a no-code "Technician" class license to have "all Novice class telegraphy privileges", including those below 30 MHz, clearly violates the international agreements.

Suggested License Class and Examination Structure

Applicant	Package A			Package B		
Already Holds	5 wpm Code	Novice Written	Technician Written**	13 wpm Code	Advanced Written**	License Issued
None	Pass	Fail	Not Given			None
None	Fail	Pass	Fail			None
None	Pass	Pass	Fail			Novice
None	Pass	Pass	Pass			Technician
Novice	Waived	Waived	Fail			Keep Novice
Novice	Waived	Waived	Pass			Technician
Novice	Waived	Waived	Pass	Fail	Not Given	Technician
Novice	Waived	Waived	Pass	Pass	Pass	Advanced
Technician				Fail	Not Given	Keep Technician
Technician				Pass	Pass	Advanced
General				Waived	Fail	Keep General
General				Waived	Pass	Advanced

If A No-code Class Is Created Against My Advice:

None	Fail	Pass	Pass			No-Code License*
No-Code	Pass	Waived	Waived			Technician
No-Code				Fail	Not Given	Keep No-Code
No-Code				Pass	Pass	Advanced

* As I amply show elsewhere in these Reply Comments, I oppose any no-code license class.

** The Commission could further simplify matters by having but a single written exam for all classes except Novice. This exam should approximate the current "Advanced" level of difficulty. However, the difficulty of this exam would probably reduce the number of people entering amateur radio.

OUR 5-WPM LICENSES ARE A BETTER SOLUTION THAN NO-CODE

12. Philip Karn and others claim that foreign experience shows that a no-code license has brought many people into amateur radio. This claim cannot be supported by data. In fact in Table 1 and paragraphs 4 and 5 of my original Comments, I presented data that shows that only Japan has a significantly larger number of hams per capita than the US, even though many countries enjoy the "benefits" of a no-code license. If no-code brings so many people into amateur radio, why don't the no-code countries have more hams per capita than the United States?

13. It is not surprising that foreign hams enter the amateur ranks with a no-code license, since their only other choice is

usually a 12-wpm or higher code test. In the US we have the 5-wpm Technician and Novice entry points. Great Britain is just now instituting a Novice entry point, with a simple written test like our Novice exam. They are making this change in an effort to reverse the stagnation and aging which has occurred in their amateur population despite having had a no-code license for over 25 years. By having the 5-wpm Novice and Technician entry points, the United States has demonstrated the ability to attract as large a portion of its population to amateur radio as have the no-code countries (Japan excepted), and at the same time has maintained the common skill of cw, which I contend is needed for effective sharing of the amateur bands among the many modes of operation. Just talk to any Japanese operator who is interested in Moon-reflection communication (or other highly advanced communications techniques) about trying to share bands with no-code stations.

IS THE RADIOTELEGRAPH CODE RELEVANT?

14. Of course my answer is "yes". The concept that one is fully capable of operating an amateur radio station without knowing the radiotelegraph code seems like expecting to be licensed to drive without demonstrating the ability to parallel park. I can hear it now: "Parallel parking is irrelevant. I only drive in the suburbs. You never have to parallel park in malls. We have a loop driveway. Why I hardly ever have to back up, much less parallel park! Parallel parking is just a 'hazing' ritual to keep people from becoming drivers." Or mathematics: "Why should I have to learn multiplication and division when I have a pocket calculator?" Despite Kantor's claims, the present 5 wpm requirement is low enough, and does not represent "hazing". Most of the foreign countries with no-code do not have our (better) 5 wpm entry point.

15. A real likelyhood is that utter and complete ignorance of cw will breed an under-class of amateurs who blunder about the amateur bands unable to comprehend "what those beeps are". Given enough such "communicators", unable to figure out what is going on, the activities of advanced amateurs will be rendered impossible and they will abandon ham radio. As I said in my original Comments, knowledge of the radiotelegraph code is fundamental to the effective sharing of the amateur bands among all the various interests.

16. In his paragraph 11, Philip Karn deprecates learning Morse Code as offering no room for creativity. The same argument could be made for the learning of the FCC regulations concerning amateur radio, or even for learning the English language itself. "I ain't got no reason for English learnin'; them peoples get me good now." Yes, correct English is just another example of rote learning and doesn't offer the room for creativity just demonstrated.

NO-CODE LICENSEES LOWER TECHNICAL LEVEL IN GREAT BRITAIN

17. The experience in Great Britain seems to disprove the contention by Philip Karn, Brian Kantor, and others, that a no-code license would bring in many highly technical amateurs. The British have had a no-code, VHF-and-up license for more than 25 years. It has the same written exam as their full license. I understand that there are approximately equal numbers of no-code and with-code licensees. I have totaled, by license class, all of the authors of all the technical articles in all the 1989 issues of Radio Communication, the most important British amateur radio journal. There were 57 technical articles, 3 were written by no-code licensees, 4 were by foreign hams (most/all held full licenses) and one was written by an unlicensed person. The other 49 were written by full-code (12-wpm) licensees. In fact the authors of over half the papers (29) were licensed before 1964, the date the first British no-code license was issued, and thus could not have even entered amateur radio by the no-code route! If 50% of the British amateurs are no-code licensees, yet they write only 5% of the technical articles, I conclude that the British no-code license is a refuge for less-technically-capable people, even though the minimum entry level is set by the same written examination as for their full license. I doubt that a no-code license would do any better in the United States. It would only offer a lower-effort entry for those who want to "talk on the radio".

18. Philip Karn and others also assert that a no-code license is a way to draw highly-technical people into amateur radio. They have privately complained to me about Table 2 and paragraph 7 of my Comments on PR 90-55. As I understand it, they challenge my contention that nearly all of the highly technical US amateurs hold 13- or 20-wpm licenses, however they have not furnished me with anything but unsubstantiated, non-numerical counter-claims (lots, many, "I", ...). It seems very unlikely to me that the 5-wpm code requirement keeps many highly-technical people out of amateur radio, when my data shows that most highly-technical people who are already amateurs have no trouble with much faster code. I feel this justifies the conclusion that our present 5-wpm code requirement does not discourage many other highly technical individuals from entering amateur radio. I suspect that Philip Karn's technically-advanced colleagues (his paragraphs 8 and 9) give the code as the reason for not become amateurs as a simple and polite means of terminating the conversation.

ALLOWING NO-CODE ON 50 AND 144 MHz BANDS ILL-ADVISED

19. Philip Karn, Brian Kantor, and others, contend that the characteristics of the 50 and 144 MHz bands do not differ from the higher bands, and thus there is no reason to forbid no-code licensees from operation on these bands. This is false. William Tynan probably knows more than any other person about what is actually happening and being attempted on the amateur bands above

50 MHz. As pointed out in his Comments, the 50 MHz band sees world-wide F-layer ionospheric communication during years of high solar activity. The 50 MHz band sees sporadic-E ionospheric propagation over distances as far as US-to-Europe each Spring, summer, and winter. These conditions are more like those on the 28-MHz band than to the bands above 200 MHz. The 144 MHz band occasionally sees sporadic-E ionospheric propagation. Both the 50 and 144 MHz bands see considerable auroral propagation. In all of amateur radio's history, the E-layer modes have only been seen a handful of times above 200 MHz. F-layer propagation will never been seen on any amateur band above 54 MHz. So, the propagation characteristics of the 50 and 144 MHz bands are often quite different from the bands above 200 MHz, and the long-distance modes on these lower VHF bands often require the use of radiotelegraphy.

20. The Commission must not make frequency assignments (that will not be changed for many years) that only perpetuate the most backward of today's operating habits. The notion that 200 MHz and up is some sort of useless wasteland unsuitable for "real" amateur radio is a know-nothing backward-looking symptom of the lack of initiative in many radio amateurs. No-code licensees on these higher bands would inspire the availability of even cheaper commercial equipment for them, giving even the lazyest amateurs an easy way to join the activity on them.

21. In a real-estate analogy, allowing no-code operators below 200 MHz is like permitting all new construction be in the center-city, no matter how much the crowding, rather than establishing zoning which requires some to build in the suburbs - for the general public good. And in amateur radio there isn't a cost penalty for using the 50 and 144 MHz bands, as there would be in buying city-center land. There is nothing preventing the addition of 220-and-higher inputs and outputs to the existing 50 and 144 MHz FM and packet repeaters, to fill the alleged population gap on the higher bands. This is commonly done today in the case of 144 and 440 MHz repeaters. Cross linking between bands need only continue until the level of experienced amateur operation on any specific higher band reached a critical mass. The FCC would be failing in its stewardship of amateur radio if it didn't encourage operation on the higher amateur bands by limiting the no-code operators to them.

22. Philip Karn, in particular, espouses a "trickle-up" theory which says that you can increase the use of the bands above 200 MHz by letting no-code licensees operate on the (lower) 50 and 144 MHz bands. He is willing to see this create such chaotic crowding that amateurs will be forced to move to the higher bands. In the first place this violates the Commission's stated intention of not negatively impacting current amateur operation. In the second place, there is ample evidence that allowing a class of license voice operation on a lower-frequency band will depopulate higher-frequency bands. A few years ago the Commis-

sion opened part of the 28 MHz band to Novice and Technician voice operation. This has resulted in a reduction in use of the bands above 50 MHz by these licensees. The chairman of the Radio Society of Great Britain's VHF Committee told me that the creation of the 50 MHz band in Great Britain has greatly reduced the population of their higher VHF and UHF bands. Most of their no-code operators moved to the 50 MHz band.

PACKET RADIO PROPONENTS OFFER UNBALANCED VIEW

23. Brian Kantor and Philip Karn do not present a balanced view of amateur radio. Their interest is primarily packet or digital communication. In fact their interest is primarily in the control protocols for this type of communication, which I believe is also their field of employment. This is a very narrow facet of amateur radio. People with these interests often consider the "radio" part of amateur packet radio to be something of an adjunct, and want to use the simplest, lowest technology radio possible. For example, almost all VHF amateur packet radio uses FM-FM modulation (AFSK-FM), one of the least efficient modulation techniques available. Perhaps these people want no-code licensees on the 50 and 144 MHz bands because the "radio" part of packet radio is so secondary to them that they don't consider the greater good that will result from populating the higher amateur frequencies.

24. Yes, these people talk about the wonders of digital signal processing (DSP), but it isn't here yet in amateur radio, and is still very expensive in the commercial communications world. While great claims are made for the effectiveness of DSP, I have never heard of its practical use in amateur radio, with amateur-priced components, and most of the commercial and government uses are in an environment quite different from the amateur bands. There are a few cases where cheap special-purpose integrated circuits have been developed at a cost approaching a million dollars for specific consumer products such as compact disk players. DSP proponents still use the abilities of a skilled code operator as a standard of performance (see Kantor). But they also often stack the comparison by considering unrealistic receiver bandwidths, etc. Communicating with a hundreds of million dollar satellite on a private frequency isn't a lot like amateur radio.

STATION IDENTIFICATION REQUIREMENTS FOR NO-CODE LICENSEES

25. While researching the technical level of no-code licensees in Great Britain, I came across a requirement of the British licensing regulations that must become part of the US regulations, should the Commission adopt a no-code license. The British correctly assume that, since their no-code licensees have not demonstrated their knowledge of the Morse code, the code they send may be unreadable. Thus, the British require no-code licensees to identify their code transmissions by voice. This means that no-code licensees may only use code in those band segments also authorized for voice. In order that the FCC be able to ful-

fill its enforcement responsibilities, it too must require that no-code licensees identify, on the same frequency, in voice. This means that no-code licensees cannot be allowed to transmit in any cw-only band segment. This agrees, in part, with the Comments by Kenneth Hendrickson.

CONCLUSIONS

26. The US 5-wpm license classes are a much better solution than the no-code licenses used in other countries, and have resulted in the US being a leader in terms of radio amateurs per capita. Only Japan has significantly more amateur operator licenses per capita, but they are perpetual licenses not indicating current activity.

27. If the Commission persists and lowers the entry requirements by creating a no-code class of license, it should realize:

> It is likely that FM, packet, TV, spread-spectrum, and other wide-band modes will wipe out highly-technical advanced weak-signal VHF/UHF activity unless the narrow-band, weak-signal activity is given subbands specifically protected against these modes. New licensees would be welcome on the narrow-band subbands when using the appropriate operating modes and practices.

> To reduce its processing load, the Commission should require that the Volunteer Examiners give the entry-level examinations as a package, to encourage entry at as high a license grade as possible. It should also attempt to transfer much of the FCC Amateur data-entry load to volunteers.

> Allowing a class of license voice operation on a lower frequency band depletes the population of the higher VHF/UHF bands. Links between present FM repeaters on 50 and 144 MHz, and repeaters on 220 MHz-and-up, will ensure that no-code licensees restricted to operation above 220 MHz will not be isolated.

> In the US, 5-wpm licensees are conspicuously absent from highly-technical amateur radio activities. I expect this to be true of no-code licensees as well.

> British experience shows that no-code licensees write very few technical articles for amateur journals, and thus I presume them to be of generally lower technical ability than the licensees proficient in code.

> No-code licensees, when attempting to use cw, must be required to meet the transmission identification requirements by using voice, since their lack of knowledge of the Morse code may result in unreadable telegraphy transmissions.

NOTICE

I am providing copies of these Reply Comments to all those parties whose Comments are mentioned herein.

Respectfully submitted this 6th day of September, 1990,

Robert J. Carpenter

> My guess is that (1) converting to FM would be super expensive for airlines and general aviation aircraft owners and (2) the taxpayers won't foot the bill for the jillions it would cost to change all the ground stations.

Because it works just fine, the way it is. Also, the aviation modulation method and frequencies were chosen in the DARK AGES = < 1936, before there was stable FM (remember the "AFC" (Automatic Frequency Control) on FM radios, circa late 50s? I wouldn't have wanted that in my airplane.

I agree. The receiver was an AR-1 (ever more rare) ,the antenna
coupler was an AC-1 and the VFO was a VF-1.

>ham transmitter. I worked 35 states on CW on 7.180 (different band plan)
>using that little AT-1. The AT-1 is a simple and reliable little transmitter
I was on 7192, this was 1954. I begged and begged and got one for Christmas
that year and built it up. I was 13. I built it twice, rebuilding it after
I learned to solder properly!
>and represents what ham radio used to be. Mine had the 6L6 replaced with
>a more modern 2E26 although the 6L6 is still available.
>
>The AT-1 is a classic. Enjoy it!
>
I only have the case of mine left. I cannabalized it for parts when I didn't
know any better(sigh).

An amusing story is the "35 watts" touted for this little box. I built up
a pair of 6l6's for a plate modulator and worked lots of europeans on
10 meter AM in the summer of 1955. Then came a QST article where someone
measured the output from the AT-1 on 10 meters and it was only 5 watts!
DX with 5 watts AM and an "End Fed Zepp" antenna. Not bad. Wish someone
would give me one, I'd probably have it bronzed!

paul@hpldola.HP.COM (Paul Bame) writes:

>So quick... what's the length of a half-wave dipole for 2 meters? Well

>naturally, it's 1 meter - half of 2 meters! No formula required. A
>2m quarter-wave is then 1/2 meter long which is about 19.7 inches - not
>bad for no formula.

Not quite. At exactly 1/2-lambda, the reactance of your dipole is
not going to be zero. So, the formulae that are commonly published
aren't that useless, albeit they are in some sub-units of a furlong.

Anyway, Paul, your problem is that you think of 144 as the "2m-"
band. Think of it as the 81-inch [3^4] band (and 440 as the 27-inch
[3^3] band), and you too, can design antennae using a common household
ruler. :-)

Flat Earth forever! (No long-path to worry about :-)

I think the aviation bands were set up before narrow-band FM was in wide
use.

Sure - there is a toad infesting usenet by the name of Jack Schmidling
who signs his anti-semitic ravings using "Amateur Radio Foundation"
and prefaces his arguments with "ARF says:" Myself and other hams
have publicly objected to his use of the terms Amateur Radio
in association with his disgusting racism. He is, apparently, a
licensed ham. I believe that ARF is related to BARF which is
responsible for the current 14.313 mess, but I'm not sure of that.

> 6. Discharge of a Nicad is critical only if the cell is under a load.

> When loaded, the cell voltage should not be allowed to drop below 1.1 volts which is just over the edge of the discharge end of the curve. Allowing the cell to drop to 1.0 volt or less while under load may cause permanent plate/electrolyte damage. The result would be a loss of cell capacity. Of course, a loss also takes place naturally with age which limits the number of charge-discharge cycles the cell is capable of supporting before it is exhausted.

The nominal cell voltage is something like 1.2 volts. An 11 cell pack which gives me 13.2 volts, would give me 12.1 volts at this level of discharge. There are packs available as low as 7.2 volts and the radio words well down to 6 volts. So how does one know when the cell voltage is below 1.1 volts? This is NOT an easy thing to do. The radio will still be operating when the cell is dogn to 0.6 volts.

In fact I quesdion that this level (1.1 volts) is even correct as the point where damage can occur. If it does, it appears to be very subtle.

> 9. Over the years, there has been many a discussion about Nicad cell memory. Yes, Nicads do have a memory function which can be aggravating if not understood. Simply stated, if the cell is used only over a small portion of its total capacity for at least 60% of the cycle time, the cell capacity will assume the more limited capacity value. To avoid the tendency of a memory condition inhibiting use, allow the cell/pack to be fully charged and discharged at least 60% of the total charge-discharge cycles. If in doubt about what is a full charge or what the discharge condition happens to be, then allow the cell/pack to fully discharge, unloaded when below 1.1 volts/cell, about one out of ten cycles. The

But what if the pack is already below 0.6 volts/cell as a result of ordinary use?

> charge rate from full discharge should be C/10 for 12-14 hours to cause as much chemical conversion to occur as possible. Charging at twice that value is not a problem as long as the cell doesn't start out-gassing (Monitor the temperature and taper off the end charge rate).

Most likely its an harmonic from the station transmitting on 9580 kHz
at the same time.....
Just a few milliwatts of RF at 28 Mhz are capable of worldwide
coverage, especailly with a sensitive communications receiver
and a good antenna at the receiving end. It is possible that the
output of the broadcaster is within the limits regarding harmonic
radiation but I suspect it is not.

STS-35/SAREX LAUNCH DELAYED

HR AMSAT NEWS SERVICE BULLETIN 251.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX Mission Delayed Due To Hydrogen Leak

NASA officials have informed AMSAT-NA SAREX personnel that the launch of STS-35 has been further delayed due to a small hydrogen leak in the aft Shuttle engine compartment. Although a smaller leak this time than the one which caused a roll-back of the Shuttle Columbia several months ago, technicians found that the concentration of 6,000 parts/millon of hydrogen in the engine compartment was enough to cause concern to delay the launch and begin repair operations. All radio amateurs who have been looking forward to this exciting mission are asked to have a little more patience while these "pesky" leaks are being fixed. According to NASA officials, the earliest the Shuttle Columbia can be ready for lift-off is September 17, 1990. All SAREX operating times are based on Mission Elapse Time (MET). So regardless of the launch date, operating schedules found in past ANS bulletins and in W1AW bulletins will still hold. Amateurs will just need to recompute the time based on the new lift-off time. Likewise, all operating frequencies for the SAREX packet radio robot operations will remain the same. However, as the STS-35 launch approaches again, this pertinent information will be repeated. Please stay tuned to AMSAT HF/VHF Nets and AMSAT News Service (ANS) bulletins for further updates on the launch of STS-35. Also, W1AW will be providing updates on the launch during its daily CW and Voice bulletins.

FO-20 IRREGULAR TRNSPNDR OPS

HR AMSAT NEWS SERVICE BULLETIN 251.02 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

Fuji-Oscar 20 Experiencing Temperature Problems

JAMSAT reports that since emerging from an eclipsing period in late August, FO-20 command stations have been having difficulty controlling the temperature aboard FO-20. Battery temperature had risen to over 40 deg. C when mode-JA and JD in simultaneous operation. Even after turning off both transponders last week, the temperature of the was still at 35 deg. C. If the batteries are left at these elevated temperatures for any prolonged period of time, it significantly reduces the battery life. (As a point of reference, the Microsat Battery temperatures typically hover around 0 to 5 deg. C.)

While the command station is collecting data on this problem and works on a solution, it can be expected that FO-20 will not be on any sort of regular operating schedule.

NK6K Provides Answers About Future PACSAT BBS Operations, PART I

AMSAT-NA Area Coordinator Jim White (WD0E) has asked some questions that are probably of general interest to OSCAR satellite users about the PACSATs and AMSAT software engineer, Harold Price (NK6K), has responded with the following answers.
WD0E: "Which PACSAT will commence BBS operations first?"

NK6K: "UO-14 is now about 80% functional with the BBS software. AO-16 will be brought to that level, then LO-19.

WD0E: "Will the TLM or Whole Orbit Data (WOD) format, frequency or any other parameters change?"

NK6K: "This is more of a spacecraft control than an application question. There is nothing in the new code that will require a change. WOD will probably end up as files, and be downloaded or broadcastable. This means that it won't come down in frames sent to WOD, but the internal record format will be the same. I'd like to see some compression on the WOD, but we may be running out of code space. If it is compressed, the groundstation software will know how to decompress it. We'll do a update to the Operating System runtime libraries next year that will give us back some program memory. There would be no frequency changes."

WD0E: "Will people still be able to just digipeat through the PACSATs?"

NK6K: "This has not yet decided. Digipeating is a good way to check out your station. I don't think there is much other demand for it in the long run, The MICROSATs are available now for digipeating, but you don't see much of this type of activity. I would not want to see digipeating supplant the intended use of store-and-forward data, but if there is a big demand I suspect it would be addressed."

WD0E: "How will the "user" ground software be distributed and tested?"

NK6K: "Jeff Ward (G0/K8KA) and I have discussed two approaches. However, nothing has been finalized. The first approach is to make a minimum implementation of the user ground-based software available, including C language source code, as shareware. We want to get something out soon, and, since Jeff and I are IBM PC-based, availability of code will hopefully encourage others to write for MAC, Amiga, C-64, Unix, and others. The only downside is we don't want to leave the impression that all AMSAT offerings are shareware. The minimum implementation will not be automated, and will not be pretty (colors, windows, pulldown menus, etc.) but will be more portable. The second approach is for AMSAT-NA and AMSAT-UK make available an "all-singing-all-dancing" PACSAT groundstation program. This will be automated, easily interfaced to terrestrial BBSs, and will have a fancy menu driven format. No source."

PACSAT BBS INFO, PART II

HR AMSAT NEWS SERVICE BULLETIN 251.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

NK6K Provides Further Answers About Future PACSAT BBS Operations, PART II

WD0E: "How will WOD dumps and BBS output be interleaved on the downlink?"

NK6K: "The broadcast protocol provides for demuxing broadcast files. This is probably how WOD will be done. These frames are sent to the address QST-1. Direct connect BBS file transfer is done in frames sent to the user's address. The broadcaster controls the repetition rate for simultaneous broadcast files, based on the number of user's requesting a file, or the file's priority. The method for prioritizing broadcast vs. direct connect (FTL0) is To Be Determined."

WD0E: "How will people know the BBS is running and available? Will they be able to tell by looking with an ASCII terminal program, with TLMDC or similar or will they have to have the ground software to tell?"
NK6K: "Much ado will be made. Also, you'll see frames sent to QST-1 with a PID of BBS."

WD0E: "Will the user ground software be available before the BBS in the bird is turned on?"

NK6K: "Available, yes. Widely distributed? No. We have to have it running on the air to give it a good test, but don't want to subject it to simultaneous connects on the first day. Once a week's worth of testing by users has been successful, the shareware will be placed on Compuserve and elsewhere."

WD0E: "Will you be testing BBS and ground software together for a time prior to making ground available? How will people know that is happening?"

NK6K: "Yes, we will. This is happening as we speak on UO-14. People will learn the same way as always, via official AMSAT Nets and publications."

It is hoped that these answers from NK6K will give radio users a further understanding about the PACSAT user BBS software.

SB ALL @ AMSAT $ANS-251.06
AO-13/AO-10 TRANSPONDER SKED

HR AMSAT NEWS SERVICE BULLETIN 251.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 8, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060
The September 10 attitude estimate is:
BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals started showing signs of FMing. Therefore, until further notice please DO NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

> of charge-discharge cycles the cell is capable of supporting before it is
> exhausted.

The nominal cell voltage is something like 1.2 volts. An 11 cell pack which gives me 13.2 volts, would give me 12.1 volts at this level of discharge. There are packs available as low as 7.2 volts and the radio words well down to 6 volts. So how does one know when the cell voltage is below 1.1 volts? This is NOT an easy thing to do. The radio will still be operating when the cell is down to 0.6 volts.

In fact I question that this level (1.1 volts) is even correct as the point where damage can occur. If it does, it appears to be very subtle.

> 9. Over the years, there has been many a discussion about Nicad cell
> memory. Yes, Nicads do have a memory function which can be aggravating if

> I'm no longer that fast, but using Super Morse, I can copy fairly
> reliably at about 13 wpm with the computer keyboard. Unfortunately
> I am nowhere near being able to copy by hand at 13 wpm for General.

But isn't it TRADITIONAL to copy code by hand? You should learn to
write faster and ENJOY it. That's what makes a ham a good ham. :-)

Now to be serious.

Part of the problem of copying code fast is copying it onto paper fast.
We all know one can copy to paper faster by typing. If you find that

typing (be it to paper or CRT screen) is faster and better, by all means you would use it in your station. I see no reason you cannot be tested on this. Hopefully, if code was coming along at the speed you could copy by hand, you would be able to do it that way.

Code tests should NOT discriminate:

1. against people who cannot print or write on paper by hand at the speed they are trying to copy, when some other simple means is usable, such as a typewriter, or a computer performing only that basic function.

2. against people who are deaf, but can copy code by means of visually watching a flashing light; a means they would likely be using in a station they would operate in code. This does not conform to the term "copy by ear" which really should be changed to "copy by ear or any other human sense". That would even include touch.

3. against people who have certain limited hearing impairments that require the code be sent at a particular pitch. One can easily tune a CW/SSB receiver to select whatever desired pitch they want (the good ones anyway) so why not be able to tune the pitch of the code in the exam.

I have the hearing impairment described in number 3. The local 146.76 repeater in Champaign IL uses an ID-er with a pitch in the range that I cannot hear changes taking place. It seems to be up around 1500 hz or so. What it sounds like to me is a tone that just slightly wavers with amplitude. I can tell it is ID-ing by hearing that pitch. When I hear some other sound at that pitch, it sounds like the repeater ID-ing. When I hear that sound, I often find myself looking around for the radio that was left on.

Be sure to understand this. I *CAN* hear at that pitch, and I can hear very weak sounds. But the problem is that variations in amplitude are not heard over very short periods of time at these certain pitches. I seem to be able to hear code fine between 450 and 700 Hz.

> Nowhere can I find any rule that explictly requires that the code test
> be taken by hand, but I have been made to understand that bringing
> anything to the test but paper, pencil and maybe a calculator is
> forbidden.

Then call up all the VEC's and ask them if they allow you to copy by ear with a typewriter or keyboard.

> Is there a rule, or is this just something became THE WAY IT IS DONE?
> I can understand that typewriters used to be big and noisy, but most of
> the new electronic typewriters are small and relatively quiet. Now if
> I could convince the VE's to allow a typewriter, I could be going for
> my General in October instead of Technician.

I've seen no such rule. There occaisionally are VE's that refuse to allow one to do things that are perfectly legal. For instance some VE's in this

area recently refused to allow someone who was either a Novice or Tech (I forget which) to take the 20 WPM code test. They were required to first take the 13 WPM code test. The FCC rules specifically allow one to get a class of license based on having passed a code test of a higher speed.
I don't know what ever came of that case, but the guy ended up not taking any tests there.

If anyone have any news of the whereabouts of 9k2kw,Farid please contact me via this mode. The latest info I have is that he was visited by Irag soldiers and suffered equipment damage.

I do not know if 9K2KW is ok or if he suffered bodily harm. Farid is a good friend and is well known in the amateur community. Lets hope that he is ok.

Ground loop communications - yes get the stakes as far apart as possible
at both the transmitting and receiving ends (so as to maximise the area of
soil energised). Wet soil is best. Make use of any local features (like
ponds, streams, swamps) to get a good low-impedance connection.
If you are after voice comms, consider using a power oscillator and
modulating this (try something around 60 to 80kHz) as you will get greater
range.
FM is probably best. Beware of harmonics of TV scan oscillators, switched
mode power units etc; these are horrible rasping noises!
If using a PLL detector, you may find that it locks to one of these nasty
noises instead of the intended signal.
If you use AM for the oscillator, consider using a communications receiver
that tunes down the LF end as the detector. Some ex-military
radios go down to 60KHz. Alternatively a phase-lock-loop (NE565) does a
good job with FM.
If you use raw audio rather than a carrier-based system, a receiver notch
filter to take out the local mains frequency can help. Alternatively use
a low-pass filter to slice off everything below about 300Hz.
I have got about 3/4 mile with 60-watts (TV sweep-tube) and a commercial RX.
Try using forks or shovels as the ground electrodes (they have a larger
surface area so reduce the coupling losses).
During World War 1, rifle bayonets were used as the electrodes, and
'spark' transmitters using rotary-wheel interrupters to generate the
signal.

An additional problem is that a ham radio which is capable of
AM airband use can be used only in emergency situations. Most

administrations require type approval for airband radios which is
not the case with ham equipment.

Good point, but the price difference is not that much. $13 for the
alkaline pack, $5 for the plug, a couple more for the regulator ... I
am just going to buy the adapter. Now, if I had an old cigarrette
lighter plug, and an old regulator around, I would build one.

Fellow Netters,

I have a friend who has an older ICOM 2AT. He claims this is different from the 02AT....Anyway, the radio does not have the capability to transmit OR receive below 144 MHz, or above 147.995 MHz. We are interested in expanding the frequency range so that it can transmit and receive on Civil Air Patrol frequencies, down to about 143 MHz and up to about 150 MHz.

Are there mods available for this radio? If so, can someone please send me a copy of these? I do not have any ftp access, just email and usenet access.

Thanks much!

Diana

[etc. all of which i cheerfully agree with...]

One added point: The full charge voltage is dependent on the cell temperature. I haven't the data handy, but the full charge voltage _rises_, noticably, as the temperature falls. If the battery is always at constant temperature when charged, the temperature dependence of the voltage is not a problem. If the battery is cold, undercharge, if warm potential overcharge or damage.

This is characteristic of NiCd and Lead-Acid systems, and, i believe of all rechargeable systems...

Heath has been owned by many people throughout it's lifetime.
DAYSTROM - SHLUMBERGER - and I believe they were even independant
originally. A few years back they were bought by ZENITH. It was hoped
by us old time Heath users that that would spark new life in Heath
because of Zenith's large market for consumer electronics. Actually,
it was business as usual.
About a year ago, Zenith was bought by Honeywell-Bull. (yes it is french)
Assuming they only wanted the computer part of the company, I asked a
Zenith Rep what affect it was likely to have on Heath. He said he didn't
expect any change to the companies product line as a result of the sale.
So much for his opinion.

>
>I'd like to see Heath bought by R. L. Drake and get both back in the ham radio
>business.
>

I think this is the most likely of the possibilities. I all likelyhood
the company will change hands yet again and there will be no apparent
difference in it's operations.
Of course the other possibility is that because of the high price of
Heath's equipment compared to Japanese rigs, the company will not be
seen as competitive and therefore a bad investment, resulting in the
demise of yet another of ham radios traditions.

As an aside, I don't really understand the high cost of Heath gear today.
I doubt seriously that any of it is made on this side of the ocean
anyway.

A very spffy way to drill holes into automobile sheet metal is by using a drill bit made specificly for the job. Larson has available (for ~$21.00) a 3/4 inch bit that has pilot bit and a ridge that keeps you from punching through the headliner while removing the paint back a 1/8 inch back from the 3/4 inch hole. Very SLIC bit and well worth the cost for headliner protection when drilling for NMO style antennas. Highly recommended.

Swiss cheese-style autos forever...

> too much.

This is a parallel of the trust put into CAE programs. "You don't need to measure anything anymore... just simulate it"

> Unfortunately, many schools are using the models to excess without giving
> students a firm grasp of the fundamentals and the knowledge that your model
> may not always be right.

I go further than that. The model is *always* wrong. It may be close enough to give you acceptable performance, but it is always incomplete....

I also agree with Barry that an independent measurement is probably the only way to get really useful numbers.

For a little while after the ARRL stopped allowing gains to be published a few manufacturers managed to slip some beamwidth data by in their advertisements. If one can make some asumptions about antenna efficiency this is pretty close to a gain specification.

Measuring HF antennas pretty much requires an expensive range, either outdoors or a very expensive one (nearfield) indoors. Qualifying a range is no small job in itself. This whole problem speaks to the end user's expectations too. A large yagi 10 boomlengths from the a perfectly conducting ground is not likely to behave the same as when it is located one boomlength above typical urban clutter and ground.

I question the value of any single number which can be applied to an antenna to indicate its value. Since the number only makes sense in one context (the range) and the degree of variability over all the likely applications is so great I'm not sure that it serves to do much more than provide fodder for late night 75 Meter arguments.

Maybe a column of testimonials is just as good...

I have a friend who is interested in obtaining some ham software for the
Apple IIc. He called me, because he wanted my software (for Macintosh)
on his computer, and I told him it's not compatible and I have no intention
of trying to make it compatible.....I don't have access to an Apple IIc.

Anyway, he's interested in a Morse code program, speed must go down to 5 wpm,
since this is for a prospective ham. Also, he's interested in any software
available for the technical written tests as well, similar to my Novice thru
Extra Ham Stacks for the Macintosh.

If any of this stuff is available, could you please email me how to obtain
these programs?

Thanks much!

By the way, just to remind everyone, the Macintosh Ham Stacks (you must already
have HyperCard) that I wrote are available to any or all who send a SASE,
plus 800K diskette:

S-Meters do not measure signal strength. They measure the voltage or current at some point in the AGC circuit of A PARTICULAR receiver. Since no 2 AGC circuits are exactly alike (even in the same production run of a given radio), using S-Meter readings as an ABSOLUTE indication IS INSANITY. They are useful only for relative measurement (comparison purposes) only.

Hi, I want to put a CTCSS encoder in an FT747 HF transceiver to use a 29Mhz FM repeater which requires the tone.   The technical manual for the 747 apparently shows provision for such a device to be added "FTE-10 option", but this option is not available at my local emporium, nor is it mentioned in the operator's manual.
I'm sure I can handle this project, but why re-invent the wheel if someone else has already designed the mod.?
So, . . anyone have a circuit?, or measured suitable signal levels for the subaudible tone injection?, or any helpful comments?

Since I have yet to see any comparisons between the Icom R1 and the AOR AR1000 I thought I would post my comparisons.

Comparing R1 and AR1000 only major differences hi-lited.
This mostly compares functionality.

General

AR has 1000 memories, R1 has 100 with some dedicated to certain functions.

R1 has signal strength meter
R1 has a clock and related timer functions.
R1 allows you to adjust display contrast
R1 allows you to turn the display on/off on a button push, or off after 10 seconds.
R1 power saver is selectable.
R1 has a receive LED that lights up when a signal is received, it can be disabled.

R1 frequency range is 100khz - 1300mhz
AR1000 8khz - 1300 mhz, missing the TV band.

Both have a tuning knob.
R1 tuning increments are
0.5, 5, 8, 9, 10, 12.5, 15, 20, 25, 30, or 50 khz
The AR1000 is from 5 to 995 in multiples of 5 or 12.5 khz

Scanning between a lower and upper bound.

Each scanner allows you to have ten upper and lower bounds. However, the AR1000 allows you to link them.

Both allow you to blank out frequencies in the search bounds. The blank outs are stored in memories 79 down to 20. This will over write whatever you had in there. The AR 1000 has this feature too, but you get 100 blank outs (lock outs) per search bank.

The R1 has an auto-write feature that will store a frequency when it breaks squelch. It uses memories 80-99 for this.

Scanning memory channels

R1 has a mode in which memory channels are scanned based on the modulation of the carrier, AM, FM, NFM.

The AR1000 organizes the memories in 10 banks that allows the scanning of any combination of banks with individual channel lockouts with in the banks.

User Impression

The R1 looks nice and its very compact. However, the buttons are too small. That and the weird memory organization are what I don't like about it. The signal strength meter is very nice.

The AR1000 has very poor documentation. After talking to someone who had an AR2002 and now has the AR1000, he has found many short-cuts and undocumented features that make using the AR1000 simpler than would appear. Late note, apparently the documentation has been upgraded.

They both seem equally sensitive. I could get WWV on both of them at 10 MHZ, and I went from there through 800 MHZ.

Rumor has it that the IC2-SAT will demodulate AM if the "FUNCTION"
key is held down for a "long time". The radio will also tune down
to the aircraft band. Can anyone give details?? ... Steve

It is true that the aviation bands were set up before nb fm was popular.

I had heard that the reason for staying with AM is that when two different
pilots are transmitting at the same time on the same channel, the tower can
sort of make out what is being said by each. This allows an emergency to
break in to another transmission. With FM, the capture effect eliminates all
but the strongest signal. The weak signal makes just a little squirmy sounding
squeal.

I have just received a form letter from CQ Commuinications Inc. to previous authors in HRM. You can probably get more info yourself by contacting
Terry Northup, KA1STC
Editor
Communications Quarterly
Main St.
Greenville, NH 03048 USA

Phone (603) 878-1441
FAX   (603) 878-1951

This letter from Terry introduces the concept of their new publication "Communications Quarterly" -- The Journal of Communications Technology. The journal is scheduled to premier in mid November 1990 and is geared to the tastes of "dedicated Radio Amateurs -- those constantly looking for technical challenges"

Terry is "looking for articles which push the technical envelope to the limit." The editorial review board is broad in background with a lot of former HRM authors and a couple of old HRM staffers. According to Terry, each isue will run about 100 pages of editorial material and advertizing

part will be "strictly limited." Articles will flow from page to page without interruption from ads. An open layout format will be used. Terry finishes by saying that their current payment schedule is $40 per printed page with part payment upon article acceptance and the balance upon publication. She claims that this is actually more than the old HRM rate due to the open format layout.

I went out to buy a FT757 or ICOM 735/725/726 and ended up getting the
TS-440 with the antenna tuner.

>
>Actually the TS-440s, IC-735, and FT757 are all in the same class in
>both performance and price.

Uh, correct me if I am wrong, but when I looked the 440 was approximately
$100 more than the 735 or 757. And thats not including the tuner. Add
another $200 to the price of the 440. I was told that the built in tuner
will not tune if swr is greater than 3:1. More or less if the antenna
is not cut for the band it wont tune it. Is this true? I lack experience
here. If this was the case then I really don't see its purpose except to
save finals on band edges. Personally, I also like the built in tuner;
it sure beats the expensive external auto units made by yaesu and icom.
Though it will not work on 160 meters, which I don't use right now.

Unfortunately, Rick, I don't think you'll have much luck finding mods for
typical HT's for operation in the aircraft bands. The reason being that
2m is FM, and the aircraft band is AM. I know of one _mobile_ rig that
can receive (and maybe transmit) in the AC bands, that being one of the
Azden units. Icom sells an aircraft radio with a built in VOR, but it
doesn't do 2m. Sorry I couldn't help any more that this, but that's
all you get for free :-).

Recently I obtained the all mode squelch modifications for the Kenwood TS-680S from info-hams. A friend of mine installed the modification as described and reports thatt it works fione and that he has noted no degradation of performance of the rig.

He also reported that you'd better have some experience before starting on this mod.

(Elaborating on nice ground-communication article by Pete Lucas, G6WBJ):

Modern Electronics magazine, Sept. 1990, has an article about through-the-ground communication using a stereo amplifier and matching transformers. The author recommends using equalizers for best results.

I've done earth-dipole experiments using a 200-watt cop-car amplifier, with a 400Hz Variac (tm) for matching. ("Earth dipole" is the preferred term for ground communication; "earth current" is naturally-occurring current through the ground, associated with aurora, magnetic storms, etc.).

I once connected a pair of ground rods to an audio-frequency spectrum analyzer, to look at the 60-Hz harmonics. The strongest harmonic is 180 Hz, probably a 3-phase effect. The harmonics extend into ultrasonic frequencies, but the strongest are below 600 Hz. A high-pass filter which cuts off at 600 Hz works well for separating hum from voice. Cutting off at 600 Hz eliminates a band of voice frequencies called the First Formant; characteristics which identify individuals' voices are lost, but intelligibility remains.

Some LF/VLF experimenters have developed a microprocessor-based adaptive filter which samples the ambient 60Hz waveform and makes a replica 180 degrees out of phase. It's said to reduce hum by 50 dB.

Nathan B. Stubblefield of Murray, Kentucky, apparently discovered the inductive and earth-current communication principles. He demonstrated wireless voice transmission in 1902, long before radio was practical, using magnetic induction to communicate several hundred feet. His equipment was made of telephone components, and used no amplifiers (which were not invented until 1907). He did not profit from his inventions; numerous articles recount his tragic story.

Stubblefield also communicated to a reported range of one mile, apparently by injecting current into the earth between two widely-separated ground rods, and detecting the signal between a distant pair of similar grounds.

Perhaps Stubblefield discovered the earth-current effect during his work as a telephone repairman. Old-style telephones with internal batteries and hand-cranked ring generators (including military field-phones) can operate over a single wire, using earth for the return path. Stories from World War I tell of using ground probes to intercept enemy telephone traffic along parallel trenches, without direct wiretapping.

When warring governments suspended ham-radio activties during the 1940's, some disenfranchised hams communicated by "ground wave," using audio amplifiers to feed currents into the earth through pairs of ground rods. Ranges greater than one mile were claimed.

Stubblefield may also have discovered that the earth-dipole and induction methods interact: Alternating current through the ground creates a magnetic field detectable by coils. Conversely, an AC-carrying coil induces currents into conductive earth, which are detectable by ground probes. The well-known interaction is used in geophysical prospecting methods. Cavers who have built baseband audio communicators which use both inductive and earth-current modes report that induction works best through dry, highly resistive rock, but earth-dipole provides best communication through very conductive overburden. At one location, the soil in the bottom of a sinkhole was so conductive that magnetic signals from an underground coil were undetectable on the surface, but when the transmitter was switched from coil to probes, it became loud and clear through the surface receiver with coil antenna. British cavers report that inductive communicators sometimes do not work in caves under highly-conductive peat bogs.

How very true, Bill! The SB-1400 transceiver is a Yaesu FT-747GX
with some cosmetic changes. The two-meter line is reportedly built
by Standard. However, the SB-1000 linear is American made--it comes
from Ameritron (an AL-80A by any other name...).

Hello...

I am getting back into Ham radio and need to get some old equipment repaired. The repair shop I took the equipment to years ago closed up shop with out repairing the equipment, and managed to loose the schematics.

I am looking for a Schematics/Owner Manuals for a Multi-Elmac, (6-80M).
The three boxes I have are :

1) Trans-citer Model AF-68A
2) Receiver Model PMR-8
3) Power Suply M-1070 Multi-Products Company
Oak Park Mich.

I am willing to buy an old manual off of someone or pay for Xeroxing.
I can be contacted any of the following ways.

William Buhnerkempe

Sorry for posting this, but I couldn't mail direct.

For Azden PCS-3000, the CTCSS tones come from an after market tone board installed inside. How to set it depends on what board you have installed. The one from Azden (actually from amatuer wholesale or who ever sold the radio) is usually from Communications Specialists. If the installer followed instructions, there should be a label on the inside cover to show the dip switch settings. If you don't have the list, you should be able to contact the TONE BOARD manufacturer for the settings. I have the comm-spec (ss-32 I think) board in my PCS-4000. If you email me direct and I can get mail back to you, I'll send you the settings.

73,
Michael

Let's hope so, remember that Heath in Canada was shut down only
six months ago.

They had a weird warehouse sale, all these bargins, but most of them
were to sell off the accessory kits that Heath has for their products.
So if you had some of their test equipment and wanted the add-on
for it, fine, otherwise you got a box of random parts. Of course,
the selection of stuff was limited, but they had lots of what was
there.

```

There was a recent message, originally about one-board computers, which lapsed into criticism of BASIC and garbage collection. Although this is a ham radio forum, many of us are BASIC programmers (or were) and some comment is appropriate.

BASIC itself does not specify a particular garbage collection process. Each individual implementation does so by some means, but the speed and efficiency varies with each interpreter. In the Commodore 64, the specific type mentioned, garbage collection occurs almost always as a result of string manipulation. Except for those defined in statements (such as PRINT "This is a constant string"), all strings are stored dynamically in the "heap". Commodore 64 BASIC saves them along with a pointer to the location. When the heap gets too full, BASIC stops interpreting, and starts through the heap, from top to bottom, checking to see whether the strings are still in use. Each string is then either discarded, or relocated higher up in memory until ALL THE HEAP has been checked. For programs like editors, this can be a large amount, and can lock the machine up for quite some time (tens of minutes). This is specific to the Commodore 64. On the Commodore 128, with a larger data memory, the process is different, and a garbage collection of the entire heap takes less than 5 seconds.

As a side note, there was a short machine language program published in either COMPUTE'S GAZETTE or RUN magazine (I can't remember just now) that "cured" the C-64's garbage collection problem, and cut the time from many,many minutes to less than 3 seconds. If anyone really needs to know, drop me a note here and I will look up the issue for you.

Thus, this longish note is just to remind everyone not to lay blame for a particular machine's characteristics on a language. As was recently noted, the controller versions of BASIC, usually limited to integer math and constant strings, can fly right along, and do make programming much easier than assembler.

Along the subject of ground pegs, I went to the local hardware/building supply store and bought a supply of really large (12") spikes, soldered or brazed the ground wires to these spikes at the ends and in the middle and drove the spikes in the ground. They keep the wire taught and also afford "some" contact with the ground. I know they are iron, you have to use muratic acid flux to get solder (use 50-50 and a propane torch) to take. Do everything you can think of to neutralize the acid before you solder on the radial wire, soak in sodiumbicarbonate solution for a while and wash with water. Yes, the spikes do oxidize somewhat when in the ground but they are a decent hold down. Now if you could get them to take a good thick copper plate. May want to try using the spikes or some other core item inside a length of soft copper water or refridgerant tubing and soldering (brazing is really better) the ground radials to the copper, drive the copper into the ground, remove the spike core and fold over and crimp the end of the copper tubing. The concept is cheep and should work quite well. For those with problem soil you could use plumbing fittings and make the copper tube into a water ram drill to get through clay. For shale, put in anything that will work, the copper is probably too soft.

Actually, the "file format" is only important to the validating agency (ARRL/QST), the manufacturer and to anyone wishing to purchase the disk models. The model format or model specification is the important concept.

> such a requirement does not end up becoming a requirement to use any
> particular program. The requirement should only specify, or refer to

The requirement of a specific program is that modeling results may not be repeatable on other programs. At the very minimum, the model algorithm must be the same in all programs used in conjunciton with the specification. Model execution may vary from program to program due to the various efficiencies addressed by the program developers but the results must be the same for identical model input specifications. It is the consistancy of the modeling results from consistant inputs that is necessarilly the cornerstone of the proposal.

> a published specification, of how the antenna model itself is formatted
> so that ARRL or anyone else (if the model is released to the public) can
> study it using the tools of their choice.

MININEC input format is (can be) in ascii, no need to actually have the program to write the arrangment of wire segments, source values and phasing and select ground type to specify the correct model for the antenna. With an ascii description one could model the antenna to ones content. MININEC is in the public domain and available through several sources including the excellent archive at WSMR, SIMTEL-20. It does require BASIC to run and is fairly large. Several parties have made more user friendly forms of MININEC available. The concept is that the model be easily documented, described and easily replicated. The results should be consistant and that is the reason I have suggested a readily available program.

>
> If NEC and/or MININEC are good programs (and having never used them I do
> not know) then they can stand on their own w/o ARRL mandating their use.

The mandate is first in model description, that it be consistant and, second, in the tool used. Quite a few institutions and organizations put a lot of stock in NEC and MININEC (within the limitations of their performance) to allow the selection of these modeling algorithms to be considered as standard.

>
> The ideal program is one that is well documented, runs on all major system
> types, has source available, and is free. Ideal programs are rare so we
> have to live with less than ideal programs at times.

I grant that neither of these programs may be ideal on ALL points but at least MININEC is free, can run on most major systems (maybe not cp/m, Commodores etc.)and is moderately documented. The publication of a "SPEC" would add documentation and allow repeatable modeling.

A lot of us are interested in interfacing our PRO200x series scanners to our
computers. Just what does your program manage? Is it a database program that
keeps track of what you have programed into each of the 400 channels? Or does
it actually control the memory of the scanner itself through some sort of
hardware interface? I can keep track of what I have programmed into memory
with dBASE or some other database manager. Computer control of entering
frequencies into memory or recording active frequencies in search mode would
probably interest a lot of us. How about a few more details on what your
program actually does?

You'll probably get a million replies about this --

There is no reason why you can't use a typewriter or computer to take the code test, as long as it's you and not the computer that is taking down the code. In the Mass/NH area, every VE that I talked to said that their organization would be willing to test people who used typwriters as long as the applicant gave them sufficient advanced warning that they could set up a separate test area (so the keyclicking wouldn't bother the people who were trying to take the test in the more traditional way.

Hmmm...the formula that I found in some old engineering reference is:

%Life = (Rated Volts/Actual Volts)^(13.1)

Thus, the ratio is raised to the 13.1 th power...

I put this into a Lotus 123 spreadsheet and ran out a bunch of typical values... a 10% voltage reduction gives almost a 400% increase in bulb life! Conversely, a 10% overvoltage brings the life down to 30% of the manufacturer's rated value...

A good reason to find 130 VAC rated incandescent light bulbs for those sockets way up high over the stairways that are sooooo hard to get to.

Hi there from the Great White North.

A lot has been said recently concerning microcontrollers of the MCS-51 family (8751, 8031, etc).

A poster recently described his G.E. Cell Phone as being 8031 based.

So to assist the home brewers out there who want to modify their cellphones for use as I.F. strips for microwave units (my desire) or as high speed packet units, I offer some software we developed for another project: the MCS-48 and MCS-51 disassembler! The package is rudimentary, but it works fine. It is necessary to examine a dump of the binary to find non-code areas since the routine isn't smart enough to save itself if it gets mixed up (reminds me of the infamous diagnostic in the CP/M BDS C compiler: "I am totally confused.") Anyhow, a sucession of trial disassemblies and refinements of the tables will usually do a good job on the code.

Email me at my site and I'll send you a copy, (C source etc.) but be warned, it's not a commercial product and the documentation leaves a lot to be desired (like documentation).

Is G.E. the only vendor of cellphones to use the 8031? Go ahead, dismantle your new toy and let the net in on it. Enquiring minds want to know.,

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),
National Water Research Institute,
Burlington, Ontario, Canada.

The future lies ahead. And behind us lies, lies... lies.

These usually turn out to be 3rd harmonics from the 31 meter band. Radio Havana is especially notorious, as is "La Voz Del Cuba Independiente y Democratica", an anti-Castro clandestine getting $$$ from the U.S.. Wait until both bands are in and check it out.

>WB0QWS

I used a utility knife. I took a piece of tank coil stock (the hollow kind) and bent it to feed #25 enameled copper beside the knife blade into the ground. I then wrapped electrical tape around the handle of the utility knife and the tube.

With one stroke, you cut the sod about 1.5", and the tube feeds the wire into the ground. I laid over 20 radials this way one morning. It helps if the ground is damp. What you're really after is for the grass roots to grow over the wire so you don't hit it with a lawn mower or dethatcher.

By the time you divide your power by 30-50 radials, #25 wire is JUST FINE. Also, the length doesn't seem very important, because the earth detunes the wires laid in it. (ever wonder why the FCC specifies .4 wavelength radials for commercial stations ? It's non-resonant ! It apparently doesn't matter.)

Most of the antenna current happens close to the base of the antenna, so extremely long radials are a waste. For this reason, "more and shorter" is better than "few and longer". Resonant radials are only needed in above-ground installations. Being a hypocrite, though, I laid one 30' radial just because the lawn dimensions allowed it.

Yo Rusty ! I just heard 10 meters open up again last weekend. You came back just in time.

And talk about open ! My first contact was Anchorage, followed by Bar Harbor, Maine, followed by Tokyo. I just love 10 meters.

Actually the "parts" I referred to was the hardware platform.

This is one of the things that makes software homebrewing fun.

With an edger or a turf cutter (as used at turf farms). Actually almost any
tool that will cut a narrow slit will work. Poke the wire down into the slit,
tamp, and sprinkle.

I'm looking for a used ICOM R70 that is in excellent condition.
Please send email if you have one that you would like to sell
(or if you know of someone that is selling one).

Thanks,

Try making a slit in the turf. I have heard of various tools being used for this, including an ax. I understand that it is best to use INSULATED wires for buried radials. The idea is not to have a good ground connection, but to make an efficient ground plane, with as little ground losses as possible. That is why it is probably best to mount the vertical up a little bit, with sloping above-ground radials (if you can get away with it).

The AT-1 was Heath's first amateur transmitter (someone correct me if I'm wrong). I have a story about the AT-1..it goes like this:

When I was 12 years old I worked in the supply store at my local elementary school, I was also a coin collector. One day someone purchased an eraser using a 1931S penny. I swapped the penny out and took it home. Much to my astonishment the penny was worth $30.00! A ham friend of mine traded a Heath AT-1 transmitter to me for that 1931S penny. It became my first ham transmitter. I worked 35 states on CW on 7.180 (different band plan) using that little AT-1. The AT-1 is a simple and reliable little transmitter and represents what ham radio used to be. Mine had the 6L6 replaced with a more modern 2E26 although the 6L6 is still available.

The AT-1 is a classic. Enjoy it!

The frame identifies me as 'one of them'. Maybe I'm an off-duty copy or something. When given a choice between 10 different speeding vehicles, maybe I'm a little less likely to get picked.

Ham plates end up having various usefulnesses regardless of what the original intent was, including:

1. Identify the car as likely having communications equipment and a skilled operator who knows how to use them. A police office in a situation where he needs communication capability, and knows what a ham plate means, could go to that car. He could also look for antennas and maybe get a CB-er.

2. Identify you as "one of the fraternity" to other hams, who might end up honking "hi" or your call at on the horn, or call you on 146.52 if

equipped for 2 meters.

3. Make you look "normal" in hamfest parking lots.

4. Make people ask questions in which can get to say "It's ham radio...
...would you like to know what hams do these days?".

5. A way to make it a lot easier for you to remember your license plate
number.

Except at hamfests, most thieves probably don't know the ham plates mean "open here for free radios" but the antennas usually do a good job of this (and magmounts can be taken down and hidden). Thieves at hamfests probably know that there is just as much chance of a radio in a car with or without the ham plates.

The specification for antenna models should specify the format of the file that is submitted, and that file format should be in the public domains so such a requirement does not end up becoming a requirement to use any particular program. The requirement should only specify, or refer to a published specification, of how the antenna model itself is formatted so that ARRL or anyone else (if the model is released to the public) can study it using the tools of their choice.

If NEC and/or MININEC are good programs (and having never used them I do not know) then they can stand on their own w/o ARRL mandating their use.

The ideal program is one that is well documented, runs on all major system types, has source available, and is free. Ideal programs are rare so we have to live with less than ideal programs at times.

=========
SpaceNews
=========

MONDAY SEPTEMBER 10, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* TITAN ACCIDENT *
==================
A fatal accident occurred on Friday at Edwards Air Force Base in California when a Titan-4 booster rocket fell on its side and its bottom section ignited while it was being moved. The latest news report indicated that one worker is missing and another was injured in the accident.

Edwards Air Force Base is the primary landing site for U.S. Space Shuttle missions.

* SHUTTLE TROUBLE *

A hydrogen leak with Columbiae has forced a delay in the launch of STS-35. Assuming the problem can corrected with minimal difficulty, the earliest launch date will be around September 17th.

And if NASA didn't have enough trouble with technical problems, there have been reports linking the operation of solid rocket motors, like those used during Shuttle launches, with destruction of the Earth's ozone layer.

* OSCAR-17 NEWS *

Here is a message recently received from DOVE-1:

```
DOVE-1>BRAMST <UI>:
Greetings to the delegates to the AIAA/USU small satellite
conference from AMSAT.  The DOVE spacecraft is transmitting
3 plus watts.  DOVE will be reset soon for software
uploading. 73 de BM.
```

* MAGELLAN UPDATE *

So far, there has been no explanation for the periods of signal loss experienced during recent radar mapping of the surface of Venus. Mapping is expected to re-commence shortly.

* OSCAR-11 NEWS *

Has OSCAR-11's Digitalker got laryngitis? It has been silent for several months now, and telemetry analysis shows that the Digitalker is now drawing much less current from the spacecraft's +5v power bus than it has in the past. Here are a few samples of Digitalker current before and after the silence:

```
03-Mar-90 at 14:30:25 UTC - 16.51 mA
31-Mar-90 at 01:03:34 UTC - 27.17 mA
08-Apr-90 at 14:20:50 UTC - 12.09 mA
19-Aug-90 at 14:44:07 UTC -  0.91 mA
01-Sep-90 at 14:00:26 UTC -  0.91 mA
```

At the present time, Digitalker periods are silent. The OBC status messages as well telemetry channel 62 indicate the Digitalker is indeed turned on. Has anyone got any explanations?

* SpaceNews NEWS *

Sorry for the lack of SpaceNews last week! I got quite involved writing some telemetry analysis software and did not have enough time to get an issue together.

* TNX QSL! *

Yup, the stuff really works. I did the same with a 5 watt audio amp as the transmitter and a phono premap as the receiver when I was in high school. We even hooked up a CPO to the transmitter stakes and went to a pair of high impedance headphones. The best we got was across the back yard but that was because we had to stay connected to the AC lines for the power source.

Good Idea for Cub Scout level activity, I think this is just what the doctor ordered.

>Bruce Thompson, WB0QWS asks: "...does anyone have an easy way of putting
>radials under the lawn (without a shovel)?

I always use a hatchet (or "axe", if you prefer) to carve a little trench out. It's not that much work, especially compared to ditch-digging!!!

One trick that my friend AA2AY told me is to lay the wires along the grass in the fall (when lawn mowing is over) or spring (before it begins), pulled taught with a stake at each end (railroad ties would work; grounding rods would probably be better, but could get expensive if you've got a complicated installation). When the grass thickens and grows back, it should cover it up.

Right now, I'm installing a more reasonable ground system into a house that is wired like a grape vine. I "obtained" some belden 1/2" flat grounding strap. I was nervous about putting the Radio Shack model grounding rod (hey, they're convenient) too close to the house, so I picked a spot, but it's only about 2 feet away from the foundation. (We have a full basement). Does anybody know how well this grounding strap holds up? Is it safe to bury it?

Finally: the soil is reasonably moist, and not particularly sandy, from what I can tell so far. Should I bother with some sort of electrolyte, and if so, anybody got a good recipe?

Control BASIC and Commodore BASIC are similar only in their syntax. The controller BASIC that I have used only allows static variables so garbage collection is never an issue. The language is optimized for interrupt servicing and bit level control. It shouldn't be called BASIC I guess, but the syntax is similar. It is easy to debug without an ICE, and the tokenized program is very small. You could write slightly better code directly in assembler, of course, but it would take much longer and debugging would require an ICE. It also only supports integer math, but for the majority of control applications this is a plus not a minus. I have used this to develop a one of a kind machine controller for a garment plant. Since it was a retrofit to an existing machine and quite a bit of experimentation was required to make it work the way the customer wanted, it was a huge advantage to be able to make changes in real time on the factory floor and debug problems as they came up. If I had used a controller programmable only in assembler, it would probably have exhausted both my and my customer's patience before we got the machine doing exactly what he wanted. This SBC from Octagon Systems allows you to develop code in RAM from a terminal, and then with a single command, burn the code into on board ROM.
In this application the SBC was able to service three separate interrupts with an aggregate frequency of 200 interrupts per second and drive sixteen solenoids while maintaining a 19.2 kb link with the terminal. This kind of performance should be good enough for all but the most demanding control applications. I'm not saying that it's better than programming in assembler from a raw performance standpoint, but it is certainly "good enough" and short development cycles count for a lot out in the field. You do have to develop a new coding style to get this level of performance though, nice clean modular code is out the window, subroutine calls cost too much in this enviornment. You tend to use interrupt service as much as possible with global flags used to communicate with the main line code running in a polled loop.

Help! I am off to Hawaii on vacation in a couple of weeks, but can't get hold of an ARRL Repeater Directory (everyone seems to be out!).

Can anyone tell me the good 2M and 440Mhz repeaters in the Honolulu area and on the island of Hawaii (I expect to tour from Hilo and cover most of the island in a rental car)?

Any othe pointers/hints etc? (I don't plan on leaving things in my car BTW :-))

A ham magazine (probably QST) published a short article about a "ground-radial plow" in the '60s or '70s. It's a steel blade, perhaps 3/8 - 1/2" thick, 3" wide, 2' long, sharpened on one edge. It's attached to the back end of a large garden-tractor (preferably one with a low gear range). I've never tried it; it would probably be most convenient if made retractable. Watch out for underground utility wires/pipes!

Here is an article about ni-cad batteries that someone asked for on the net a few days ago. This has been posted before. I apologize for the redunancy.

-Randall KK6MY

NICAD CELL CHARACTERISTICS

by

Hugh W6WTU

The operating characteristics of a Nicad cell are very basic in nature. During charge, only current and cell temperature are critical. Discharge may occur at any current rate until the cell terminal voltage falls below 1.1 volts, but the cell temperature rise must not cause the cell electrolyte to boil (gas). When connected in a pack, the pack must be unloaded when the individual cell voltage falls to 1.1 volts to prevent reverse charging of the lowest voltage cell in the pack.

Few applications discharge cells at an excessive high rate where gassing becomes a problem, with the exception of toy electric cars (These are toys for men). Cells designed for this application usually have larger than average plate area and large connecting tabs to support the higher peak current. Cell temperature is kept below the critical value by selecting the cell capacity such that the cell will dissipate its charge before gassing occurs. In essence, the toy car runs continuously with a nearly zero series load resistance allowing the cell temperature to rise near critical just as cell discharge is reached.

The following brief notes will further amplify an understanding of Nicad cell characteristics.

1. Nicads are very easily damaged due to gas pressure caused by over-charging at high charge rates. Unfortunately, Nicads do not have a positive indicator for indicating the state of charge. It is up to the user to estimate the relative charge state. Typically, the charge rate is calculated at C/10 where C equals cell capacity and the 10 represents hours for charging. At C/10, a nominal or normal charge would occur. A fast charge can be accomplished, cell design permitting, by changing the ratio,

i.e., 5C/2.

2. Cell temperature does rise at the completion of the charge cycle, particularily at high charge current values, and can be used as a charge completion indicator. At the moment of temperature rise, the charge current must be reduced immediately to prevent excessive gas pressure build-up. Some chargers monitor the cell temperature and reduce the charge current to a small sustaining value. For 500ma cells, the sustaining value is typically between 10-25ma, or just enough current to compensate for the chemical change (internal current leakage).

3. Pulse charging of Nicads is most preferred as it is more efficient than a steady-state current value. Steady state current creates gas bubble formation on the plates of the cell, while pulse current tends to create fewer gas bubbles allowing the charge to be more uniform across the plate area. The charge uniformity is enabled by gas bubbles being moved around due to current pulsations. Bubble movement allows more plate area to be exposed during charge. Pulse charging also creates less of a temperature rise. The charge rate still has to be calculated as a function of C/10 during each charge pulse to determine total charge time (The accumulated charge is equal to the sum of the charge area under the pulse curve).

4. Older Nicad cells would not accept high charge rates above C/10 and would develop electrolyte seal leakage at attempted higher charge rates. A leaky seal, in any case, means the eventual loss of the cell. Newer cells, as used in most handheld radio applications seem to tolerate high charge rates without developing cell leakage as long as the temperature is controlled (kept low).

5. In the event corrosion around the seal of a cell develops, the corrosion can be removed. Wipe the corroded area with a vinegar soaked cotton swab. Use an ample amount of liquid and dry the cell with a tissue. Keeping the cell clean allows it to be used until it fails completely. Take note that weeping cells can cause corrosion problems if they are not inspected and cleaned regularly.

6. Discharge of a Nicad is critical only if the cell is under a load. When loaded, the cell voltage should not be allowed to drop below 1.1 volts which is just over the edge of the discharge end of the curve. Allowing the cell to drop to 1.0 volt or less while under load may cause permanent plate/electrolyte damage. The result would be a loss of cell capacity. Of course, a loss also takes place naturally with age which limits the number of charge-discharge cycles the cell is capable of supporting before it is exhausted.

7. Unloaded cells may be stored almost indefinately and allowed to discharge to whatever cell terminal voltage the cell can maintain on its own. When putting a previously stored cell into use, charge the cell, at least the first cycle, at C/10 for 12-14 hours. Shelf life of a cell is usually a function of how fast nickel whiskers develop internally that can short the cell. Two methods have been proposed as a way of extending cell life when whisker formation is of concern. a) Cycle the use of the cell/pack periodically. It is believed that the rate of whisker formation

is reduced when cells are charged and discharged periodically. b) Allow the cell to sit on the shelf as long as needed and if a whisker short should occur, blast it away with a high current pulse from a capacitor or other source. It has been observed that once whisker growth/shorting begins, it can not be permanently stopped.

8. It has been observed that the terminal voltage across a charged Nicad cell will increase as the cell ages. Using this observation, the life expectancy of a cell can be evaluated and monitored. As an example, a new/fresh cell will exhibit a terminal voltage of 1.25 volts while an old cell will exhibit, say, 1.5 volts. It is believed that the cell dehydrates with age and the rising voltage is a function of the increase in cell impedance.

9. Over the years, there has been many a discussion about Nicad cell memory. Yes, Nicads do have a memory function which can be aggravating if not understood. Simply stated, if the cell is used only over a small portion of its total capacity for at least 60% of the cycle time, the cell capacity will assume the more limited capacity value. To avoid the tendency of a memory condition inhibiting use, allow the cell/pack to be fully charged and discharged at least 60% of the total charge-discharge cycles. If in doubt about what is a full charge or what the discharge condition happens to be, then allow the cell/pack to fully discharge, unloaded when below 1.1 volts/cell, about one out of ten cycles. The charge rate from full discharge should be C/10 for 12-14 hours to cause as much chemical conversion to occur as possible. Charging at twice that value is not a problem as long as the cell doesn't start out-gassing (Monitor the temperature and taper off the end charge rate).

Many hints and kinks have been published regarding the nature and care of Nicads and all point to the fact that Nicads require user TLC to obtain long cell life. The bottom line is that the user must pay attention to how the cell is being treated.

When I worked as a landscaper, we used a linoleum knife (one of the ones that is curved at the tip) for cutting sod to fit. You could use one to cut a 1-2 inch deep slit in the turf, then push the wire into the slit.

Has someone had their neat wizzy toy apart yet.. have you done mods yet?

Can someone please post or E-Mail the necessary modifications for the ICOM 2-SAT that will enable it to go out of band on RX and TX ?

I have the RX mod already... RX is great over 138-174.

Does it really have a built in auto-dialer?

Yes, I know... standard disclaimers apply.

When the legs of a dipole are brought together from their standard 180 degree separation, the characteristic load impedance of the antenna decreases from about 75 ohms. I am looking for a chart which plots dipole-leg angle against the expected input impedance of the antenna.

If anyone has a reference that contains such a chart, please let me know what it is and what page it is on. Please email this one as I expect that it would not be too interesting for general net perusal.

Thank you,

Todd

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

This has been driving me batty for months...

A few months ago I traded in my Kenwood R-5000 receiver for a TS-440s transceiver. Once I connected it up to my antenna, I noticed that it was showing about 2 S-units less than the R-5000 had.

Is there a way to tweak the meter on the TS-440? I hate giving RST reports of 509 and 519 when it is obvious that though the signal is somewhat weak, it is still coming in good.

73, John/KB0HBX

Dreading the thought of burying radials, I went searching for material to build a ground screen for my 20/15/10 meter trap vertical antenna. Wire mesh cost more money than I wanted to spend, so I found a big piece of scrap sheet aluminum in my barn and put it at the base of my antenna. It is an irregularly shaped sheet, about 4 by 5 feet. A few cinderblocks weigh it down so the wind doesn't blow it away.

I made use of some heavy wire to connect the sheet metal to my ground rod and antenna mounting bracket.

Lacking quantitative measurements, I'm pleased with the setup. Originally, my vertical had no radials or ground screen, and I did notice an improvement after installing the sheet metal.

This was supposed to be a "temporary" installation, just to "get through the winter," but it's worked fine for 2-1/2 years.

I suspect the ground conductivity is pretty good here during spring and fall due to lots of moisture in the rich soil.

Getting closer to 5wpm and closer to purchasing a rig...

I am a private pilot SEL, and a (still) aspiring ham. I can justify the cost of a 2m HT MUCH more easily if it would also provide me with emergency communications while in the plane.

I've scanned the mods collections and can't find anything that would give both TX and RD from 108MHz -> 2m ham. I've heard rumors that Sony makes a special order rig, and that some company named AOL (?) also has a 2m/ aviation HT. Alas, I've been unable to run any of this to ground, so I'll make my appeal to the net. Are their any aviating Elmers out there?

Thank you!

-Rick-

I am looking for a Ham Radio Operators Club or Organization
within the city of Chicago to help me identify the source of
some RF interference I am receiving in my home Public Address
System. The source of the interference is strictly Pakistani sounding
cab drivers and I have seen many with huge antennas and been told that
they often run illegal power boosters.

Have any of you Chicago Ham Ops heard this?
Do you know what frequencies they are using?
Can they do this with 'legal' equipment?
Is there anything a Ham Operator can do to help me and the FCC
confiscate these pirate's gear?
Anybody speak Pakistani?

Thanks in advance.

I recently bought an electronic bug detector that had been made in Japan. The instructions were a little terse including one on the box which read: "Warning : This device will interfere with all short waving antenae in the room".

Someone else has reported buying a Japanese made knife which had the following warning label attached:"Knife sharp. Keep away from children and other pets".

I am putting the finishing touches on a basic program written for the c128 in 80 col. that manages the memory of the realistic pro-2005. I realize that the demand for such a program with this type of computer is limited, but I serves me just fine. This program has lots of room for more features, as I see them needed. If you want a copy, mail me directly as I can not keep up with this group. The program is shareware and the fee is $20 US. dollars, and as always, any monitary controbutions are accepted. Here is a list of hardware requirements:

C128, 80col, disk drive (1541,1571 -- 81, I have no idea as I doo not own one), and a printer is optional but recomended (serial only).

Anyone interested?

Tony

>
>Phil KJ6NN

Well everyone has an opinion. I test every radio I own on a routine
basis. I have never owned an Icom radio that did not handily exceed
it's specs while the single Kenwood radio I currently am enduring,
a TS790, meets neither it's power output spec (27 watts out, rated power
is 35 watts) nor it's sensitivity specs (rated .2 uV, actual .5 uV, for
12db sinad). It also runs uncomfortably hot and it's 430 Mhz power module
has had to be replaced (warranty). The new IC735 remains comfortably
cool after ten minutes key down at 109 watts into a Dielectric water
load (10 kw) on 14.313 Mhz (good test freq :-)).

My test bench has a HP608D signal generator, IFR 1200 spectrum analyser/ signal generator, Bird Mod 43 power meter, and several Dielectric dummy loads from 200 watts to 10 kilowatts (water cooled) all specified and tested to be flat to 500 Mhz.

Radios I have owned and tested include B&W 6100, Drake 2B, Drake TR4, Drake T4X, Drake R4C, Kenwood TS120, Icom IC745, Icom IC735, Kenwood TS790, Icom IC22A, Icom IC211A, IC451A, Icom IC402, Icom IC28H, Icom IC900, Icom IC25A, Ten Tec Argonaut, etc. This is the short list off the top of my head :-). Of them all, two stand out, the IC735 and the Drake R4C as being the best receivers I have ever used. The 735 is easier to use and is more stable, while they both are great for digging the weak ones out of the interference.

I have briefly operated a friend's TS440 and remain unimpressed. The receiver seemed only fair, the controls seemed awkward to use, and the radio got uncomfortably warm after a little RTTY work. The internal antenna tuner is of marginal usefulness with the usual random portable antenna. And who in the world needs, or can even remember what's in 100 memories?

The heatsink design on the IC735 is rather novel. First it is massive, secondly it is internal, and third it uses a squirrel cage internal blower to direct forced air over it's entire surface. It is highly effective with only a ten degree temperature rise after ten minutes key down at max power. The blower's quiet too! I stick by my opinion that it's the best radio available under $1000.

I starting to save my pennies up and hoping to by a used HT in the near future. Having a empty mailbox, I thought I could fill it up by asking from some suggestions/advise.

My e-mail address is:
mark@cs.ucsd.edu

I realize that some of these questions depend upon what I intend to use it for (which I don't know). Just assume I got my license because I played bridge with the class instructor.

Some random questions:

Is the choice of bands determined by anything other than what repeater in the area seems most attractive?

What features are essential and which are marketing fodder?

What mistakes have you made purchasing HTs that I should avoid?

What accessories (batter chargers, etc) are (a) essential, (b) useful, or (c) frivolous?

Since you have experience on your side, any general rules of thumb would be appriciated.

Thanks,
mark anderson

I have never seen one. Something you may want to keep in mind is that even though some 2m ham rigs will cover a portion of the aviation band, the aviation band is AM - most HT's I've seen for 2 meters are FM.

Anyone know WHY the aviation band is AM ?

Steve

Recently I have been hearing some very strong QRM on 15m that wipes out about 15 KHz of the band, typically 21020-030, or 21040-060. At first it sounded like ignition noise, until the person I was talking to (in Europe, both times, a couple of weeks apart) mentioned it too. It was S9 and killed the QSOs. It was there again today during the (phone) contest. It starts up around 1730 UT and goes on for several hours.

Given that it is S9, when added up over 10-20 KHz it is a *lot* of noise, and being equally strong thousands of miles away spells Big Trouble. Is it some ghastly new OTH radar system? I'd take the Woodpecker over this any day.

Anyone else heard this (you must have...), and have any idea what it is?

I did the same thing when I was in junior high (circa 1961) to communicate with a friend who lived about 1/3 mile away. We used Heathkit audio power amplifiers and stepup transformers connected to ground stakes about 200 feet apart. With a crude audio filter to eliminate the worst of the 60/120/180 hz crap the audio tones were well above the noise. There is a steady background of clicks and whistlers (sweeping tones) from lighting energy coupled into the magnetosphere, so the channel wasn't quiet. We were never able to put out enough power to send voice in both directions (the channel seemed to work best around 3-4 khz).

But dyslexic as I am, I still never mastered CW and never got my ham ticket (it was bad enough learning to spell and speak clearly). Today if I was a kid playing with this, I'd probably try to send 300 baud FSK to my home computer, but back then it was only two or three years later before I got into playing with Teletype gear and had some kind of digital signalling device that I could use. And by that time my friend had moved away (and gotten his ham license).

|>   Is there a way to tweak the meter on the TS-440? I hate giving
RST
|> reports of 509 and 519 when it is obvious that though the signal is
somewhat
|> weak, it is still coming in good.

Never trust one of those meters! Every manufacturer calibrates them
differently and they aren't very accurate regardless! Who's to say that
your
TS-440 isn't correct and your R-5000 is screwed up? Who's to say
theirs
is correct and *yours* is wrong!? Pick a number out of *your*
calibrated
ear and give it to them. S reports aren't worth fussing about. About all
the
meters are good for is, for a given radio, swapping antennas to
determine
relative differences. They can also be calibrated to determine relative
power differences if you want to measure a beam pattern. Otherwise just
stare at the swinging needle - watch it carefully - listen to me -
"you don't care about S units" repeat "you don't care about S
units".......

To clarify things a little bit,
From the California Vehicle Code 1989 edition.
(paraphrased)

5005 (a) one set of call letter plates may be issued to the holder of a
non-expired amateur radio license.
Plates may be issued for a car, motorcycle, or
truck (no trailers).
(c)(1) initial fee $20 (no annual fee)
(2) transfer to another vehicle $12
5020 call letter plates may be issued to the holder of a non-expired
class D citizens band license.

$20 initial fee
$15 renewal fee
$20 transfer to another vehicle
5021 only one set of plates may be issued per section 5020
4850 (a) all license plates issued by this department shall be reflectorized.
     (c) a mandatory $1 fee shall be charged for reflectorized plates.
4850.1 exception to 4850: environmental plates (personalized, pearl harbor survivor, former POW, congressional medal of honor, 84 olympics, purple heart, or bicentennial bill of rights plates) (reflectorized plates optional)
9250 (a) registration renewal fee shall be $22 [basic fee]]
9250.8 (a) an additional fee of $1 is required [law enforcement fee]
4602 registration must be presented at time of renewal.

so, when obtaining amateur radio plates on a car you already own,
the fee would be:
$20 for the plates
$22 renewal fee (not sure if this is required if you have already renewed)
$1 reflectorized plates fee
$1 law enforcement fee
for a total of $44 (or $24 depending on if you do it at renewal time or not)

```

Recently I have heard many hams complain that they cannot find light bulbs for the control panels of their radio equipment, and have been asked directly about same. The following bulb will replace those 12-volt bulbs which seem to be too bright and fail too quickly. If the old bulb is the small (grain-of-wheat) type used in many radios, it is destined to fail soon. The 7220 bulbs I obtained from Sylvania are rated at 18 volts and last 60,000 hours at that voltage. At 14 volts, the mind boggles, and the bulb keeps on glowing (a nice soft orange...like the TM-731A set on "dim"). I just put a pair in a Kenwood 7950...much better than that goofy green color! Good luck, and happy soldering!

Jerry KD2DR

Or you could install a power resistor in series with the light bulbs to reduce voltage and increase life. If I remember rightly, bulb life follows an equasion like:

```
/  rated voltage     \ 6
| ------------------ |   = times rated life
\  operating voltage /
```

SB RTTYDX @ RTTYDX $RTDX0907
RTTY DX Notes 1of3 9/7/90

RTTY DX Notes for week ending 9th September 1990
BID: $RTDX0907
Part 1 of 3.

After a certain amount of percussive maintenance and calibrated thumping, we have managed to get our machinery to act in the way that one would expect good RTTY gear to operate. The bands this week have been fairly slow, though it has been noticed that a certain amount of emergency and welfare traffic is still flowing around. Congratulations to those helping out.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JH1BLV, JH1QDB, OD5NG, TG9VT, VK2EG, W2JGR and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance, and may you see some really good DX this coming week.

```

RTTY DX Notes 3of3 9/7/90

RTTY DX Notes for week ending 9th September 1990
BID: $RTDX0909
Part 3 of 3.

ZK1XY is Kiyoko Yamashita, Box 3, Toukai-mura, Ibaragi 319-11, Japan.

4L9AG is at Box 6542, Perm City 614051, USSR.

Notes of Interest:

ZK1XY cards will be available on her return home.

The QSL cards for VP2V/JH4IFF should be available about mid September.
He made over 200 RTTY contacts.

JA1ACB advised that JH3DPB is now the QSL manager for 1S0XV.

JH1NQG will be signing KC6CW, and JH1BNL will sign KC6DX from September 13th to 16th, and will sign V63AN and V63AR respectively from Yap from September 16th to 19th . QSL to their home calls.
JH1NBD will sign S79 from the Seychelles from September 13th to 17th.
QSL to home call.

7J1ADJ will be active from Minami Torishima (JD1) starting September 14th for one week. QSL to KB1BE.

JH1QDB will sign /JD1 from Ogasawara from September 23rd to 30th.

Malpelo Island (HK0) should be active from 2 November.

Juan Fernandes will be activated by F2JD in mid November with RTTY gear supplied by IRDXA.

South Sandwich and South Georgia are still on track for late November.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

SB ALL @ RTTYDX $IRDX0990
IRDXA 9/90 Bulletin

September 1990 Bulletin
BID: $IRDX0990

The International RTTY DX Association (IRDXA) provides RTTY equipment

to DXpedtions and resident amateurs willing to provide RTTY contacts
from rare DXCC countries. IRDXA has no constitution, no bylaws, no
officers, no members, no meetings, no dues, and no other rules. All
projects are funded by donations from RTTY DXers.

IRDXA Project Status - 9/90

Thailand - RTTY is still not an authorized mode, although some
contacts with HS1BV have been credited by DXCC. The IRDXA PK-232 will
be active from HS1AC (science museum club station) when the mode is
legal.

Solomon Is. - H44SH made more than 1200 RTTY contacts with his IRDXA
equipment before being transfered. He will be active from TU soon.
Late QSLS to Stuart Honeysett, c/o Serabou Seed Co. 04 B.P. 161,
Abidjan 04, Cote d Ivoire, West Africa.

Tristan de Cunha - ZD9BV has worked a few on the US east coast and
Europe using his IRDXA gear. Andy is getting married in September,
so work him now!

Rodriguez - Hopefully 3B9FR will receive his IRDXA gear on the next
boat, arriving late August. Robert is very excited!

Papau New Guinea - P29BT will receive IRDXA gear this month and should
be QRV RTTY in late September.

Malpelo - Will be QRV RTTY for the 1st time in Nov. 90 with HK1LDG
on the IRDXA keys. Send extra greenstamps with your QSL requests
please.

S. Georgia/S. Sandwich - VP8SGI and VP8SSI will be QRV RTTY about
21 Nov. and 24 Nov. respectively, using the well traveled IRDXA
Hal Telereaders. S. Sandwich is another 1st time QRV RTTY.
If you know of an opportunity to activate another DXCC country on
RTTY, please call me at (213) 322-7112 or fax 213-322-7114.
Our address: IRDXA, 356 Hillcrest St, El Segundo, CA 90245 USA.

Good RTTY DX

Subject: Need Help With VAX VMS DeCompress of INFO-HAMS Archives
Message-ID: <9009010024.AA14928@ucsd.edu>
Date: 1 Sep 90 01:24:00 GMT
Sender: daemon@ucbvax.BERKELEY.EDU
Organization: The Internet

Posted: Sat Sep 1 02:24:00 1990

I need some assistance in figuring out why my efforts to decompress some `INFO-HAMS' archives (from UCSD.EDU) are not going well.

I'm `on' a VAX cluster (running VMS), and I've gotten a copy of the "lzcmp.exe" and "lzcomp.exe" files (several folks, here on INFO-HAMS, responded to my "where's a VAX VMS functional version of the UNIX `compress' program, that I posted a few weeks ago). I can compress and then decompress my files but, when I get an archived INFO-HAMS file from the UCSD.EDU archives, something goes wrong.

On two different attempts, "lzcmp.exe" gives me an error message; something to the effect that it couldn't finish decompressing the file. When I go look at the decompressed file (it DOES produce something ... that's progress over my previous efforts!), it appears as though the last portion just isn't there. A sentance will stop in the middle of a word, and the next line is the end-of-file. Theres no `garbage' ... the file simply quits before it should.

I have a `compress' program on my Amiga Computer at home, and there were some `help' files to guide me in using it. Not having any UNIX experience, but figuring that the VAX's `compress' routines would have similar options as my Amiga's (since they're both modeled on the UNIX `compress' program), I tried a "-h" suffix to the decompress command (suitably defined in my VAX "login.com" file), and sure enough, there is some rudimentary `help' information available that way ... apparently not enough though (!).

It's kind of embarassing ... here I have a nice mainframe at my disposal, and I can't decompress some simple text files. Last night I got a compressed InterNet document (the "RFC" type `stuff'), downloaded it to my Amiga at home (`KERMIT' is slow!), decompressed the file, and `dumped' it back to the VAX (again suffering with KERMIT!).

Advise would be appreciated.

Thanks,

Paul Nix   InterNet: nix%muppet.decnet@consrt.rok.com

PS - Before any VMS experts tell me about "XMODEM", as being faster than KERMIT ... I know only too well. Two or three of us have tried to get XMODEM to work, but something in the VAX-LAN-modem interface (that I have to go through when dialing in from home) `kills' XMODEM after the first blocks try to get through. KERMIT, although painfully slow, does work.

I recently got hold of a copy of the Heathkit 1990 Summer catalog. In the Amateur Radio section of the catalog, where it advertised its small packet transceiver, there was an article in the margins which made reference to the November 1990 Space Shuttle mission which was going to be sporting the Packet.

My question is if anyone knows the dates, exact times (UTC or EST), and 2 meter frequencies which the shuttle crew will be using for this project (and any other information you may have).

I am not yet licensed (but am taking my Novice exam within the next two weeks!!!), but I do have a friend of mine who has his General license.

Any information regarding this shuttle mission would be greatly appreciated.

Thank you very much.

|> This used to be true John. The networks quit doing this some time
|> ago.

It depends on where you are. When I worked at the Maryland Center for Public Broadcasting about 15 years ago, a cesium frequency reference was installed in order to conduct some navigation experiments (the Maryland Center runs a series of slaved UHF transmitters around the state that covers, among other things, Chesapeake Bay). Before that they had a rubidium standard. I don't know whether they still have it.

You can always try calling the engineering departments of your local TV stations and asking what kind of master subcarrier generator they use.

Standard broadcasting practice uses a master 3.58 Mhz subcarrier generator (usually with backup) to drive dividers that generate sync signals that are distributed throughout the station. This means you need not look at the color subcarrier to get your frequency reference; the horizontal and vertical sync signals are equally stable, and these are usually easier to extract from your TV set (especially if it is a black and white model).

By the way, with really stable (cesium or rubidium) frequency standards you can readily detect the motion of a (nominally) geostationary satellite as it carries a TV feed. I once tried this at the Maryland Center as they uplinked Wall Street Week. I watched the downlink signal on a vectorscope that had been synchronized to local (uplink) subcarrier. The relative phase of the downlink subcarrier slowly rotated as the satellite moved toward (or away, I don't remember) from the ground station. One complete rotation would correspond to a change in path length of only 40 meters (1/2 the wavelength of the color subcarrier).

First a brief statement of where I am coming from, then a request for advice:
There is indeed a big source of potential future hams. They are called Boy Scouts. Especially the younger ones who are not all wrapped up with football team, girls, and cars (not necesarily in that order). These are a group of boys who have a lot of ambition to try new things. I know, I have helped several (including 6 graders) pass their novice test.

Now, I am looking to construct a "long distance" code practice device, and welcome the net's constructive suggestions. One possibility to connect two keys and code practice oscillators with a couple hundred feet of telephone wire. Now, the boys can really communicate beyond a normal talking range.

Slightly more complex is to explore no-license transmitters. How far can they be expected to work? Lastly, what would be the simplest CW rig for a novice to cover a range of several miles? This last would allow the boys to QSO after school, and provide an incentive to the rest to get their tickets. Higher freq means smaller antenna so the radio could be taken on a campout. The object is to find an inexpensive construction project. HT's at $200 and up are not in the right budget class.

Nick,

Since I have already answered many of your questions directly I won't repeat myself on this wide forum but I just *have to (:>) clarify one point....

you say:

> 1. Of course EHF is dangerous, but is there any way to effectively quantify the hazard? This thing aparently puts out about 10 mW of power, which, with the dish, means about 10w of ERP with a 4 degree half-power beamwidth. What kind of biological hazard is posed by standing behind the dish, to the side of the dish, and in front of the dish? How close to the dish in the directions I've mentioned is considered safe? I want to be safe about this, but I'm unlikely to be able to put this thing too far away from people. If that's not safe, there's little point in proceeding.

This is a very common thread of thought, but also very misguided.
In actuality the 10 mW coming out of the dish is at least
1000 times
>>>>   less dangerous <<<<<
than the horn or (worse yet) the waveguide flange by itself.

The highest fields, those most capable of causing a problem are present when all the power is present in a small aperture. This is the case with dipoles and low gain antennas (like a waveguide flange or horn feed of a deep dish). When the energy is used to illuminate a large parabolic reflector, it is spread out immensely. The ERP only tells you what the FAR FIELD is like.. it produces the same field that it would take a much larger transmitter to produce were there no antenna gain. It does this because the signal emanating from every portion of the high gain antenna's aperture adds coherently and maximally in the direction of the beam. The *actual* power/unit area is *never* much bigger than that coming out of a dipole driven by the 10 mW source. Shortened dipoles or monopoles represent the smallest realizable antenna and have only a slightly smaller aperture than does a full size dipole. A dipole has about a 1/8th lambda square aperture so you can compute the potential for injury using your favorite guidelines... 0 dBm/cm^2 or whatever you like.

The biggest danger anyone is likely to see from these modules is probably at the entrance to your local supermarket since the door openers use a lower gain antenna. Still I suspect that by far the biggest potential for injury is from hitting your head on the door jamb....

I'll take standing (floating?) out in front of the Araceibo (sp?) 1000 foot dish with the biggest transmitter you can muster any day over peering in the crack in the door of a leaky microwave oven.

regarding the touch lamp RFI problem:
Try using an L filter instead of a PI. Connect a suitable cap across the triac and lamp, with the chock in series. Sometimes PI filters do not work as well as desired because the two caps have one lead in common. Unless the common point is really ground (which it is not, in this case) the two caps can actually bypass the chock!

trivia:

The NTSC color subcarrier (3.579545454545....) is defined in the FCC rules for broadcasting as: (5 MHz)*63/88. The vertical field rate can be derived from that with: SC*4/455/525 and you get 59.9400599400599400....

Black and white broadcasts are supposed to have the color subcarrier turned off, but I've seen many that do not. I suspect that even if they turn it off, the horizontal and vertical rates will still be synced to the source deriving from the color subcarrier anyway (and hence vertical will not be exactly 60 Hz).

>Does anyone who recently got one know about the fee?

I posted a note a little while back that I thought it cost $21. Well,
a few days ago, I got my cancelled check back, and it was... $21.00.
(Confirming that I may be getting old, but memory loss is not a
complete problem yet :-) This was a little over 4 weeks ago (nope,
no plates yet). Since Troy was given the same number by the DMV, we
can assume that there is something very wrong with the $54 number.

Now, because of my call, I wonder if most people will confuse the call
plate with a vanity plate (the plates will be on aa Saab aautomobile).
Fortunately, I do *not* look sixty (at least I don't think so :-).

  Sb: WIDE FREQ MODS IN ICOM HANDIES.
```

Several new ICOM hand help equipment have the capability of wide freq coverage by executing only simple keypad commans.

IC-2SA With the power off,hold the following keys down and turn it on.
CALL,FUNC,LIGHT then release the keys.

IC-2SAT With the power off hold the following keys down and turn it on:
LIGHT,B.# and then release the keys.

IC-24(New version only,old version need diodes cut) With the power off hold the following keys down, then turn it on:
LIGTH,B,# then release the keys after the display comes on.

With the power off hold the following keys down ,then turn it on: LIGHT,3.
This enables the 100 Mhz digit in the IC-24.

With the power off hold the following keys down,then turn it on: LIGTH,2.
This enables the 10 Mhz digit.

ICOM handies have a incredible wide frequency coverage and...with only a few keystrokes......you already modified the handies.

It may have been changed, but the last I heard, the only time an AFB uses the
120 - 130 aircraft band is when talking to civilian aircraft such as CAP,
private airplanes owned by base personnel, etc. Normal AF air - to - ground is
above 225 mhz.

The ARRL Letter - Volume 9, No. 16 - August 10, 1990 -

FCC Issues Notice on Testing of Disabled

The Federal Communications Commission on August 1 issued a Notice of Proposed Rule Making on Morse code testing of persons with disabilities. At an open meeting, the commissioners announced NPRM 90-356, proposing amended rules "to accommodate those persons who, because of severe handicaps, have extraordinary difficulty in passing the higher speed Morse code telegraphy examinations for amateur operator licenses."

While the subject had been broached earlier (see *The ARRL Letter*, June 29 and July 13, 1990), specific written information was not made available until after the ARRL Board of Directors had held their second 1990 meeting late last month.

For some time, volunteer examiners have exercised discretion in accommodating persons with disabilities, giving them several options in the testing of Morse proficiency. FCC Rules Part 97.509 (h) say "The administering VEs must accommodate an examinee whose physical disabilities require a special examination procedure. The administering VEs may require a physician's certification indicating the nature of the disability before determining which, if any, special procedures must be used."

On July 18, in a letter to volunteer examiner coordinators, FCC went a step further, asking VECs to "please expand the special procedures the VEs make to accommodate handicapped individuals."

In that same letter, FCC said "The Commission's policy is to exempt from the 13 and 20 wpm examinations persons holding a current, or within the renewal grace period, Novice, Technician, General, or Advanced Class operator license who, because of their severe handicaps, cannot pass these examinations even when the above special accommodation procedures are used."

At the same time, in what the Commission referred to as "interim procedures," volunteer examiners were given specific instructions for obtaining a physician's certificate (to the examinee's disability) as well as guidelines for applying to FCC for a total waiver of the 13 and 20 WPM Morse examinations for those individuals.

FCC said at that time that a Notice of Proposed Rule Making was being drafted.

In its June 15 statement, FCC codified procedures for accommodating disabled applicants, saying that special testing--such as substituting a sending for a receiving test, or pausing the CW tape to allow the examinee to speak or otherwise communicate the message to the examiner--now could *only* be done given a physician's certificate of disability.

The aim in accommodating disabilities is to encourage the applicant to make a "good faith effort" to pass the exam. In a recent letter to its volunteer examiner teams, the ARRL said "In most cases, the (flexibility specified by FCC) will allow the candidate to pass the Morse code examination on his/her own--therefore not requiring a waiver of the Morse code requirement because these procedures may have accommodated the severe handicap or disability."

In its letter to license applicants, ARRL says "We would hope that you have at least attempted to pass the examination using the new, more flexible examination procedures announced by the FCC June 15, 1990.

The Morse requirement in its most basic form has not been eliminated--waivers are available only to applicants already holding at least a Novice Class license. This meets international requirements (for operation below 30 MHz) that the licensee have demonstrated a knowledge of Morse.

ARRL also has provided volunteer examining teams with instructions to physicians, along with the proper form for the physician's letter to follow. Since physicians generally are not Morse proficient and may have little idea of the skills and abilities needed to become so, the League's instructions to them contain a brief tutorial on both Morse code and on how Morse examinations normally are administered.

The instructions to physicians also point out the new procedures for accommodating people with disabilities, noting that (The VEC is) "looking to you as the expert to detail why the patient may not be able to participate in the examination process" (despite the various accommodations available).

The FCC's NPRM 90-356 closes with this:

"...the proposed rule changes would be more efficient and effective than reviewing waiver requests from severely handicapped individuals on a case-by-case basis."

The Commission asks for comments "on all aspects of this proposal."

It is anticipated that volunteer examiners in particular will have something to say, both about the proposal itself and about the way in which the new procedures were announced, then spelled out, and finally followed by an NPRM initiated by the Commission itself.

As the League noted in its latest message to VE teams, now that an NPRM has been issued, the time has arrived for examiners "to express their philosophical and procedural concerns." For some initial reactions to the FCC's proposal, see "Happenings" in September *QST*.

In its June 15 statement, the FCC noted that the number of requests from disabled persons for Morse waivers had increased (although they did not say if these were requests to waive 5, 13, or 20 WPM). The FCC (namely John B. Johnston, chief of FCC's Personal Radio Branch) also mentioned that "three persons...have filed discrimination complaints under the Disability and Rehabilitation (Act).

BLIND HAM HONORED AT WHITE HOUSE

A 21-year-old Extra Class ham who has been totally blind since age 9 has received the Recordings for the Blind 1990 Scholastic Achievement Award. Scott Charles LaBarre, KT0U, of Woodbury, Minnesota, a recent graduate of St. John's University, in Collegeville, Minnesota, received a check for $3,000 from the General Electric Company for "extraordinary scholarship, intellect, enterprise, and service to others."

LaBarre, who plans to enter law school this fall, earned his Novice license at age 13 and his Extra by 14, through the Golden Valley, Minnesota-based Handi-Ham System. For more information on Handi-Hams, who have helped thousands of disabled people to become licensed, write to Courage Handi-Ham System, 3915 Golden Valley Road, Golden Valley MN 55422 (612-520-0511).

FORMER HAM CONVICTED

Richard A. Burton, formerly WB6JAC, was convicted in federal court July 20 of illegally operating a radio transmitter. Burton, arrested May 17 following an investigation by Los Angeles area FCC engineers acting on complaints from amateurs, had been charged with three felony counts of violating sections 301 and 501 of the US Code.

In the early 1980s Burton's license was revoked for Part 97 violations. After his appeals were turned down he was ordered off the air, but he continued to operate using his rescinded WB6JAC call sign. On January 15, 1984, US District Court Judge Manuel Real sentenced Burton on four misdemeanor counts of operating a transmitter without a license. Following appeals, Burton served seven months in jail and five years on probation.

Burton now faces possible fines of up to $100,000 and/or up to two years in federal detention. Sentencing is scheduled for October.

NASA TO TEST SHUTTLE AGAIN

A "tanking test" of the Space Shuttle Columbia is scheduled for around August 17, with rescheduling of flight STS-35 for around September 1, if all goes well. Ron Parise, WA4SIR, will be the SAREX astronaut on STS-35.

Astronaut Ken Cameron, KB5AWP, will speak at the ARRL Southwest Division Convention in San Diego on August 25, while Parise--who it is assumed will be in quarantine before his flight--will talk to the convention banquet by telephone.

STS-37 astronauts, scheduled to fly in November, now have received their licenses; in addition to Cameron and Jay Apt, N5QWL, new licensees include Steven R. Nagel, N5RAW, and Linda Godwin, N5RAX.

DXCC AUTOMATION UPDATE

A little known benefit of DXCC automation currently underway is that QSL cards will need be submitted only once for the multitude of awards now available from DXCC. Once a card has been processed and logged with call sign, date, band and mode, that credit will be available in future years for an applicant's band and mode endorsements.

That's the good news. The flip side is that the DXCC backlog is expected to worsen somewhat over the next year or more, as the process of "backfilling" continues. Several HQ staffers are working overtime (up to 40 hours a week) on the initial phases of automating the DXCC Branch, which now is processing submissions made in March. Mail received after June 1, which will be processed in September, will be the first to be done entirely by computer. At that time, the process of backfilling will accelerate, adding temporarily to the backlog.

OH! WHAT AN EXPEDITION

An all-Finnish team will invade the Caribbean island of Curacao in the Netherlands Antilles for the 1990 CQ Worldwide DX Contest. 55 operators and 40 support personnel will occupy both the Coral Cliff Hotel (a longtime Amateur Radio haven) as well as clear out acres of brush adjacent to the hotel in order to set up additional stations in construction trailers.

Radio Team Finland will sign PJ9W on SSB for the 'phone contest the last weekend of October, and PJ9A on CW at the end of November. Towers and antennas are currently being assembled and tested in Finland by OH6RM before shipment to the island. They will include a wire beam on 160 meters, a 3-element Yagi on 80 and stacked Yagi arrays on 40-10 meters. Rigs will be

15 Yaesu FT-1000s, with amplifiers.

BRIEFS

* Plumb Crazy is off the air. On July 6, according to the Oakland (California) Tribune, FCC personnel and US marshals, armed with a civil order, nabbed five modified CB radios and two linear amplifiers from Plumb Crazy's (whose real name is Harvey Peters Jr.) home. FCC representative Amy Freundlich said, according to the Tribune, that "the federal raiding party carted the equipment out of Peters's home to the congratulations of neighbors."

Peters faces $1,200 in unpaid fines, according to the Tribune.

* In the continuing effort to attract young people to technical pursuits, Carole Perry, WB2MGP, recently addressed members of the Society of Women Engineers at their meeting in New York. Perry told the group's education forum of the League's work to encourage youngsters to take up Amateur Radio, and suggested possibilities for cooperation between the League and the Society. Getting more young people into technology and science "is a national problem and one that requires a concerted effort between commercial interests and educational institutions of all kinds," she said.

"As I made the case (for Amateur Radio)," Perry said, "I was gratified to see how well received the information was with the group in attendance."

WB2MGP was the 1987 ARRL Professional Teacher of the Year as well as the Dayton HamVentionr Ham of the Year in 1987.

* Spurred by at least one book on the market telling the nontechnically adroit how to modify their radios, Kenwood USA Corporation has issued a press release on the subject. "MARS and Civil Air Patrol operators can obtain (Kenwood) radio modification information...at no cost. We require a copy of your MARS or CAP permit for this information.

"Please note that although modification information is available elsewhere, its validity and accuracy is questionable. Use of such incorrect information will void the warranty and possibly damage the radio.

"Kenwood policy is and always has been to protect the frequency spectrum for legitimate MARS and CAP operators. Protect your radio, and our frequency spectrum--use official Kenwood documentation."

* On July 27, the ARRL filed its legal brief with the US Court of Appeals for the District of Columbia Circuit in the matter of the proposed reallocation of the 220-222 MHz band to the private land mobile service. The brief reiterates the League's position, which already has appeared in QST. Oral arguments in the case of ARRL vs FCC and the United States of America are scheduled for November 16, 1990.

* ARRL Northwest Division Director William Shrader, W7QMU, has been named to the ARRL Planning Committee. The committee's makeup, originally ARRL officers only, was recently broadened to allow inclusion of directors and

vice directors. Vice President Rodney Stafford, KB6ZV, chairs the committee, whose mission is to draft a recommended long-range plan for the League.

* While it is not allowable to request a specific call sign, any amateur may swap his current call for another one. This little-used option is available by filing with FCC a Form 610 and requesting a change in call sign (Item 2E). In return, the applicant will be issued a call appropriate for his license class, from the standard rotation of new calls.

* The League once again has asked FCC to take action on international intruders in our HF bands; cited this time were two Soviet stations on 20 meters, as well as five intruders on 17 meters, coming from China, Argentina, the Soviet Union, and Sudan.

* Kelly Howard, N6PNY, one of the teenage stars of the 1987 ARRL film New World of Amateur Radio, was married on July 28, to Steven Lenhert. (Thanks to Westlink Report editor Bill Pasternak).

You can still do this even with the relatively unstable crystal references now used since you are both the uplink and the downlink station any drift in the reference cancels. If you want to see a real drifter, look at Spacenet 1.

RTTY DX Notes 1of3 8/31/90

RTTY DX Notes for week ending 31st August 1990
BID: $RTDX0831
Part 1 of 3.

We were speaking about QSL cards the other week, so I looked at some of my needed ones. I see that we are still waiting for cards from September 1989 and November 1989, and for cards through March and April 1990. So it seems that some people are more diligent than others. Bye the way, cards for VK9LI have been sent to all those received. But then he did not have 14,000 QSOs.

Our thanks this week go to I5FLN, I5ICI, I5IGQ, OD5NG, TG9VT, W2JGR, and the Tri-State DX Association VHF packet cluster. Thank you all for your assistance. Without your help these notes would not get written.

QSL Information:

HI8BG requests his cards be sent to Bienvenido Guzman, POB 163-9, Santo Domingo, Dominican Republic.

ED5IPE is Portillon Island, and cards go to EA5GEO.

VQ9RB QSLs via WA4DPU.

9L4BR, Richard, asks for his cards via G4GGN.

5Z4BI is Bill Hesbitt, BOX 147, Thika, Kenya.

UJ8JCQ QSL via callbook address.

Notes of Interest:

Cards for Cambodia, XU8LW and XU8DX, are acceptable for DXCC.

RA2FB is in KALININGRAD.

There has been very little new activity reported for the coming weeks, so we will look ahead a little.

```

Part 3 of 3.

JH1NBD is still heading for the Seychelles (S79) for a stint from September 13th to 17th.

DF2UU was anticipated from Iceland (TF) in August. So far no reports of his activity.

JA2NQG will use KC6CW and JH1BNL will use KC6DX from September 13th to 16th. They will then go to Yap and use V63AN and V63AR respectively from September 16th to 19th. QSL to their holme calls.

JH1QDB will sign /JD1 (Ogasawara) from September 23rd to 30th. QSL to his home call.

The Malpello operation has been advanced to November 2nd. Financial assitance may still be sent to HK3BED, Arturo Afanador, POB 91135, Bogota, Colombia.

South Sandwich and South Georgia Islands are still anticipated around November 26th. Further information may be obtained from AA6BB/U, Jerry Brandon, 93787 Dorsey Lane, Junction City, OR 97448. He will also accept financial assistance for the operation.

Sorry to say, people, there are some errors in the script this week, due to machine failures. We have done the best we can, but the rotten machines won't speak the same language that I do. I will apply the hammer and hope for better things next week.

GL DE DX1.

In the bookstore yesterday, I saw an article that might be of interest to you.

It was in one of those electronics magazines (Radio Electronics?) and
was about "through the earth" communications.

Essentially, you drive two conductive stakes into the ground, and using "around the house (who's house ?)" electronics, you communicate between them.

Range was several hundred yards. Sounds like a great Scout project!
The plans were for DX, but CW might give you better range and be easier to construct.

There is also the concept (if I might bring it up) of "homebrewing" at a higher level: developing software

The problem with this is the lack of availability of the parts. What we have now are whole computer systems (e.g. PC clones and others). While PC clones can be had for cheap as computers go, they cannot get as small and cheap as the MINIMUM hardware necessary to implement some smaller project.

Kantronics is attempting to (at least partially, e.g. for TNC functionality only) address this. I still don't have the technical data to know just to what extent this system is really open. I also hear that AEA is offering a DSP based modem. I can think of some NON-modem things I'd like to do with a DSP processor, though I suppose one could come up with a line of reasoning that argued that it was modem anyway.

The reason I am a skeptic is that I frequently get confused looks from people when I tell them I am interested in buying their piece of equipment WITHOUT the software, and empty PROM sockets, in exchange for copies of the documentation of the level needed to develop software on. One example is Spectrum, the company that makes repeaters. They offered to have THEIR programmer custom develop software to my specs at a rate that would come to about $1000. Well if I knew for certain of EXACTLY what I wanted the repeater to do, and if I believed they could develop it BUG FREE, that would be a fine price. In reality I am not sure how I would want it to behave, and getting it BUG FREE the first time is not exactly typical. If I were to program it myself, I'd be looking at burning code onto PROMS at least a couple times every month and maybe a few times in a flurry.

The guy from Spectrum also wondered why I could not just program it like everyone else does to do what I want. First of all, these things are CONFIGURED, not programmed. It had lots of features, but it also missed a lot that I wanted, particularly with configurable parameters that would dynamically change according to particular conditions based on some specified algorithm. For example, I might want the tail to be longer in the first transmission after having been idle for 2 minutes. The configuration choice I had was in simply setting the length of the tail, period.

I can understand that a company might be concern over the proprietary details of the design of their machine. If I knew how to program their repeater controller, I could potentially engineer one myself that is "as easy to program as theirs" and market it in competition. But if that was really their primary concern, they could have just said so. Instead they responded in ways in which they failed to recognize any interest in doing this form of "high level" homebrewing.

Well, maybe the Kantronics and/or AEA boxes are flexible enough to be programmed to be repeater controllers :-)

I just got a CES simplex/repeater autopatch and am trying to find out the format for the CWID PROM. Attempts to contact CES by phone have been unsuccessful (no answer). Does anyone have any info on the type of PROM and the format for the data for the CWID? Right now it has no PROM at all installed. I'd like to burn my own, as the patch is owned by two of us, and will be installed at a club station temporarily, so I'm going to need 3 different calls programmed, which is why I want to do it myself instead of paying the factory for 3 chips. I have the manual for the

patch, but no schematics, so I don't even know what type of IC it is.
Any info would be appreciated.

I was caught off-guard today while recording some weather satellite photos from 10.863 MHz USB. At 1400Z, a GOES Full Disk weather photo is usually transmitted at 120 LPM. However, instead, several MET4 low altitude weather photos were transmitted at 240 LPM! The header I managed to read off one of the images was as follows:

MET4 03 SEP 1990 1400 VISI+2 C3D

I assume that the C3D is a location. Does anyone know for sure? I could not pinpoint the geographic location by the view received. I also assume that VISI+2 is an indicator that the image was a visible spectrum image.

73, Paul

Actually, Spectrum may not be releasing details of their box for less sinister reasons than fearing the KA9GWM TurboController might be advertised in QST next month. Companies don't release the level of doc you are after for several reasons:

1. Misplaced paranoia that their widget will be cloned by a competitor. Probably not the case with a repeater controller.

2. Not having a documentation kit for lower level details. Internal docs used for programming a box are not necessarily something appropriate for use by customers. Low demand for such documents probably keep the company from investing resources in producing user level docs of internals.

3. Not wanting to support your efforts at that level. Telephone support is expensive and ties up resources.

4. Liability - it is conceivable that someone could injure themselves while futzing with the box. Probably not the case with a repeater controller, but I doubt GM will support your efforts in hacking their engine control uP.

5. They may not want to promulgate hardware details out of

concerns that a particular instance of hardware might become a de-facto standard people come to expect. Such a standard might inhibit their efforts to change their technology to eg lower costs or increase profit margins.

Personally, I don't see any reason to pine over this at all. In these days of cheap single board computers aimed at the instrumentation/embedded control markets, only the true "appliance ops" are using repeater controllers ;-)

In every case that I've pursued so far, the reason a manufacturer didn't release the low-level details of programming controllers is that he didn't KNOW them.

Typically (especially in the ham marketplace), these sorts of things are bought on a contract basis from an independent supplier, who turns over the prototype hardware and software, then works with the manufacturer until the product reaches the market. From then on, the manufacturer has the whole enchilada, with enough documents to make and sell the thing. It's unlikely his employees are intimately familiar with either the hardware OR the software.

Assuming the manufacturer in fact has people capable of working on the software, it's likely that they haven't done so yet on a new product, and probably won't until complaints and bug reports come in. Remember that a maintenance programmer often doesn't have the big picture AND the fine detail unless he's worked on the system long enough to have learned them - it's not his job, which is to fix bugs. Bugfixing doesn't often require that you know everything about the system.

Couple that with the fact that very very few of the purchasers of what is really a low-demand item in the first place will be people who want

```
to and are capable of making low-level changes in the operation of the
widget, and it's just not worth it to the manufacturer to try to
document the operation of the widget at that level of detail.

I do think that manufacturers should be willing to release source code
for their devices, perhaps under non-disclosure contracts, but none are
that I know of.

And that's why I build my own controllers.

This explains some of the p***-poor support I have gotten from certain
companies on other products (e.g. PC clone "makers" maybe?).

What a boring job, fixing someone ELSE's bad programming.

I can see this, and suspected it all along, but the ignorance level of
the people involved makes me think their line of reasoning didn't even
make it to this level. Perhaps the problem is that the guy who I was
talking to was "pure salesman", a species that should be banned at hamfests.

> I do think that manufacturers should be willing to release source code

I asked about such a thing. They said they already had programmers working
for them.

I am posting this for a friend who has a Kenwood 430S. He does not hear
a sidetone when in CW mode, and wonders if there is an internal switch
to turn on the sidetone. Can anyone help? If so, please contact Lee at
71341.51@compuserve.com. Thanks.

I haven't read anything official, but I know that when I transmit
on my 4-watt 440 hand-held into the rubber duckie, I will get a
headache within about 5 minutes of intermittent operation. That is
why I usually use low power, which doesn't give me headaches. The
same thing happens to my friend with a comparable radio.

What do you mean? One of the things that drove me towards software
development (besides its inherent fascination) was constant
frustration in getting parts for hardware development. I don't know of
any other field in homebrewing where you can easily get so many parts
over the phone. I don't mean just ordering them over the phone, I mean
actually *obtaining* them through the phone line. :-)

The other great thing about software is that it is so easily
replicated. Building the first prototype of a hardware project is

fun, but duplicating it can get old pretty quickly. Fortunately I have here a magic machine that can automatically duplicate any homebrew software project in a matter of seconds or minutes, as long as you keep feeding it electricity and raw materials. And the duplicates are just as good as the prototype...

Phil

```

There is also another issue with respect to "homebrewing".

Some people will take a project published in an article of book and built it exactly as published.

Some people will take the above project and change it, either to deal with some difference in their tastes, to make it easier (delete the tough feature they don't want), or to adapt it to a different need or project.

Some people will actually design something new.

Again, the level is important here as well. One does NOT have to construct their own inductors to do homebrewing, whereas someone else might, and in some cases you might actually have to. Try building a 1.5kw 160 meter linear.

If you take store bought gear and connect it together in some new way that has never been done before, then that is creative. If it also works, then that is wonderful. It isn't any less important. Each person needs to pursue what interests them. And each person needs to be recognizant of the interest of other people as well.

(rest deleted)

This is a good idea. But, while the max power for transmitting without a license is 100 mw, you still have to be careful and not interfere with existing licensed activity. I doubt that this will be a problem, though, because you gain nothing by transmitting on a "used" frequency anyway since the licensed transmitter will drown out a 100 mw rig.

It used tobe that you could buy transmitters and kits that worked on the BC band. Are they still around?

>How cheap and where do I get one (ONE!)?

Do your own homework, phil. Check any issue of "Circuit Celler", "Embedded Systems", "Measurement & Controls" (an ISA publication), "Electronic Engineering Times" or any other trade magazine for literally dozens of ads. The world is swamped with SBSs. HINT: The Micromint will sell you SBCs containing 6809, 8041, 8051, HC64180 or Z8 processors. The 8051 and Z8 processors are available with built-in BASIC so you don't even have to dirty your hands with assembly language.

But when you get right down to it, I don't really know why you'd want to buy just one. In about the time it would take you to order one of these boards, you can whip your own together. IN the 80[48,51] and 680X class processors, all one needs is a processor, a crystal and some line buffers (optional, depending on what you are doing.) Of course, you WILL have to buy a device programmer. Public domain cross assemblers are available for the PC and for less than a hundred bux, you can get a full simulator for any of the above chips.

John

CA used to issue call plates only to area 6 calls.  But now DMV has no area
restrictions.  I would think that most states would be the same in that the
states are aligning themselves with respect to uniformity/recipriosity of
driver's licenses.

Has anyone experience with the ICOM IC-735? I am new lis and want to
buy a shortwave transceiver. Other alternatives would be the FT-757, or
the TS-440.

The software is not the problem. If all I wanted the hardware for was for just my own use, these sources of circuits would not be a problem either (except for my current space limitations, but this can be worked around on a small scale).

What I want to be able to do is to write the SOFTWARE and either sell it or give it away, and let people put it on their own box. I do not want to be in the business of hardware. If I write an application for the PC, I do not have to sell them a PC as well.

This is why the idea of the Kantronics Data Engine interests me. It *MIGHT* be a standard and available platform for software independently provided. The AEA DSP box might have similar usability.

For hardware to qualify, it must:

1. Have no software bundled with it, or if there is, it is of only a minor contribution to the cost, and generally useful.
2. Marketed on a wide scale relative to the scope of usage intended.
3. Be completely self contained to the maximum extent the purpose requires. This would generally mean a power supply, or standard power inputs.
4. Have a changeable software medium (socketed EPROMS are fine) or at least downloadable from a personal computer.
5. Require minimum hardware work by the owner to get it up and running, e.g. install ROMS, hookup to whatever, plug in power, switch on.

> Do your own homework, phil. Check any issue of "Circuit Celler", "Embedded Systems", "Measurement & Controls" (an ISA publication), "Electronic Engineering Times" or any other trade magazine for literally dozens of ads. The world is swamped with SBSs. HINT: The Micromint will sell you SBCs containing 6809, 8041, 8051, HC64180 or Z8 processors. The 8051 and Z8 processors are available with built-in BASIC so you don't even have to dirty your hands with assembly language.

These publications have stuff generally intended for hardware hackers. That's fine for hardware hackers who want to use my software. But what about the appliance operators, or more specifically, the high level network builders?

I've never heard of Micromint. Per chance might they have a 56001 SBC? You might also mention where these publications can be had, subscription prices, etc. I've only heard of "Circuit Cellar" and last I saw, it was a column in some magazine (was it Byte?). Remember, I'm a SOFTWARE person, NOT a hardware person. I don't get, or know about where to find, such things as EE trade rags and such. But I'm sure I can understand most of the tech talk in them.

As to getting my hands dirty with assembly language, it's MUCH better than getting them bloody with BASIC. If I want a high level language, I'll use C. Unless these SBCs typically run at 33 MHz or so, I'll have to go back to assembly to get the speed I want. I do a LOT of programming

in assembly language now and am very comfortable with it on several machines,
so why should even consider BASIC? I hope I can get a refund for sending
back the ROM chips with the BASIC interpreter on them.

How about light-wave communications? Photodetectors and flashlights for example. A photodetector at the focus of a parabolic reflector can be pretty selective (Radio Shack sells both the detectors and the parabolic reflector, though they think the reflector is a solar cigarette lighter.) or you can use lenses for less distorted reception. For better signal-to-noise, you can modulate the light either by messing with its power or by reflecting it off a vibrating mirror. That would provide a tone to help "tuning" at the receive end. (You can also modulate voice onto light with similar techniques, but who's going to want to send code when they can talk?)

Score 1 for remote microphones. Also for using a roof antenna
when operating from a car.

Sorry for the weak attribution, but I do remember reading about 440 mhz
energy causing cateracts in an ~1970 issue of either 73 or RPT..
(more likely RPT..) I don't think they had any quantitative data.

To Nick Sayer et al on 10 ghz microwave links.

Several years ago, K3PGP and I had a 10Ghz microwave link between our locations which was 6.3 miles. We were line of sight. I used a 10mw Gunnplexer mounted on my tower in a plastic food container, while John's site had the Gunnplexer mounted on his tower at the focal point of a 3' dish. He also used 10 mw of power. This link was active for nearly 3 years, and we had one full motion duplex video link (2 links) and on one of the video links we also had a voice nad data link, full duplex. The r.f. and i. f. units were all home brew by John, K3PGP, and they worked without any problems over the 3 year period.

Fog caused sparklies in the video, and heavy rains wiped out the link totally. Other weather conditions were seen to cause multipath distortions. Snow did not seem to have much of an effect, although in heavy storms, some loss of signal resulted. By the way, you have never heard audio that can be had on 10Ghz, try a 150 Khz bandwidth channel for audio.

The secret of these links were the home brew i.f. systems, which were on the order of 36mhz bandwidth. This allows video and several big bandwidth audio and data channels to reside on the subcarriers of the video channel.

If you guys want a tip... buy an old 70Mhz i.f. Satellite receiver and use this for the receiver. You have the video bandwidth and the subcarrier channels already there....

Also, good luck on the AFC system.... Unless both systems are locked up by a good AFC system you may as well forget it. The system PGP used was proprietary, and it worked great at -14F and +98F. If you want to have a lot of fun, try 10Ghz. No QRM, no Tuner uppers, just find yourself a buddy who is line o site and have at it!!!!

Why bother with BFOs. Just build a little audio oscilator (or
put a little feedback into the AM Modualator) and run Modulated
CW. Why make it any harder than necessary?? If the interest is
there, you will be moving them to Ham radio soon enough anyway.

Amidon (see ads in QST) has several types of ferrite rods, including
high-mu ones apparently intended specifically for LF/MF frequencies.

I'm looking for a schematic of a Yaesu FT-127 receiver. A call to Yaesu
yielded the information that the service manual is no longer available.
The owner's manual is available, and has a teeny-weeny (almost readable)
schematic, but it costs more than I paid for the radio.

I need the schematic and layout for the receiver only. Can anybody out
there help?

Anyone who wants to do controller work had better KNOW hardware. If you
aspire to be a SBC programmer, you'd better subscribe to the EE trade
rags and learn about the hardware or you'll never have a sucessful
software product. There's no OS to shield you from the dirty details,
you have to do it yourself. You'll be debouncing contact closures, driving
relays, and trying to debug why all the !$%& relays glitch every time
you reset the cpu. I know, I've been there.

Such chauvinism! Many of the controllers have 1 or 2 Mhz clocks, yet the optimized Control BASIC that is built into the chips can do some mighty serious real time control in the available 2k of on chip RAM. Tokenized interpreted Control BASIC programs are often more compact than Forth or assembler while being much easier to prototype and debug. Controller BASIC allows you to vector interrupts directly to lines of your program. Controller BASIC gives you direct access to hardware timers and ports at the bit level. Assembly can always be called inline for the really time critical things. C and Forth are available for some of the SBCs, but you usually have to expand to off chip ROM and RAM to use them. Since it usually only takes one cpu cycle to fetch on chip code while taking several cycles to access off chip code, you pay a heavy price for using bulky C code. The stack architecture of these controller chips is not optimized for C and calling a function and passing it parameters is very clumsy and slow. You have to forget what they taught you in school about modular code and write nasty spaghetti code hoarding every cycle. Often a little rethinking of your problem will give you a one chip hardware addition that saves hundreds of lines of code. When doing SBC work, hardware and code are best thought of as intimately interdependent parts of the whole solution to your control problem.

On the topic of small HF rigs: Does anyone have any info on the forthcoming Delta II from TenTec? It looks like this rig will blow away my Kenwood TS440S based on the published specs. There's also a QRP version of the same rig (the Argonaut II) which looks very interesting. They are both due out in the fall.

I would be interested in ballpark price and any other info on these guys.

Subject: Inductance of ferrite-rod loop antenna?
Keywords: ferrite rod loop Loran-C
Message-ID: <1107@soleil.UUCP>
Date: 5 Sep 90 19:32:49 GMT
Organization: Harris Semiconductor, Somerville, NJ
Lines: 42
Posted: Wed Sep 5 20:32:49 1990

I am trying to build a resonant ferrite-core loop antenna for reception of Loran-C (100kHz) signals (for fun). The problem is in determining the inductance of the ferrite loop.

According to the ARRL Antenna Book (15th Ed), the inductance is:

L = (4*pi * N*N * A * Mu_rod) / l

Where
L = inductance in Henrys
N = Number of turns
A = Area of a loop (in cm*cm)
l = length of core in cm
Mu_rod = permeability of the rod adjusted for length/diameter ratio.

From the Amidon catalog, the permeability of one of their ferrite rods is 850. When adjusted for the length/diameter ratio according to the table in the ARRL book, Mu_rod is about 100.

So, the inductance for a 7.5 inch long .5 inch diameter loop with 20 turns is:

L = (4*pi * 20*20 * 1.61 * 100) / 19

= 42593 H (!)

This CAN'T be right. Are the units supposed to be meters instead of cm?
Is 100 a reasonable number for the permeability?

Thanks.

Due to space constraints, I can't put a regular dipole for my 10 meter rig in my apartment. What I want to build is something like this:

(The frame is a 2x6)

```
--------------
|  ......... |
|          : |
|  ......... |
|  :         |
|  ''''''''' |
|  ........: |
|  :         |
|  ....      |
|     .      |
--------------
      :  <----- Wire
      :
```

Would something like this work? Yes? No? Why?

Thanx..

Michael R. Dow

In article <141793@sun.Eng.Sun.COM>, Jonathan Neher, N6XUI, was asking what the 6m was
all about.

The ARRL has published a band plan for 6m, and it's printed in the ARRL Repeater Directory.
However, I've paraphrased it below for your convenience. You should double check the FCC
Rule Book and other amateur publications to ensure you're operating legally.

51.700   National Packet calling frequency

73,
Bayard, N1HO, who will be /1 from FN45, Pittsburg, NH on 6, 2 and 432

Thank you for publishing this... I've been looking for any info on a 6m packet frequency and this is the first I've found. Now to order the crystals and get on the air.

Anyone else interested? Packet seems an ideal way to experiment with 6m. It'll never miss an opening and I (the lazy operator) don't have to constantly monitor the radio.

Bill WA7NWP

Paul Flaherty:

> >On a similar thread (since sci.engr isn't here yet): Who is responsible for
> >keeping the brain damaged English units as the primary measurement system
> >in the US? NIST? Congress?

And from Phil:

> We have met the enemy, and he is us.

And "us" includes us amateur radio operators.

I was lucky enough to be schooled during the time when the metric system was being pushed in the USA. Then my science/math/engineering education used it even more - slugs and feet became things to be converted to metric before doing calculations - maybe that makes me communist or something I don't know.

Anyway, I started pursuing my ham ticket and lo and behold, there for all the world to see in our training literature (and in the Handbook and who knows where else) was the formula for the length of a half-wave dipole antenna:

(1) l = 9827397.23847 / f

where the length is in feet or inches or something - please excuse the made-up constant. And this formula usually comes *after* we know how to talk about 2-meters and 146MHz as the same band. We're already using wavelengths in meters so why suggest people memorize brain-dead useless formulas and constants? Instead, we could present the formulas in the metric system and provide units conversions for folks who don't happen to have metric measuring tapes - conversion being a skill they could use in other walks of life.

So quick... what's the length of a half-wave dipole for 2 meters? Well naturally, it's 1 meter - half of 2 meters! No formula required. A 2m quarter-wave is then 1/2 meter long which is about 19.7 inches - not bad for no formula.

For closer results, like for 2 meters where small errors in antenna lengths are significant, the formula to remember is still simple

(2) l = c / f

which says that the wavelength is equal to the speed of light divided by the frequency. That 'c' value, the speed of light, is a useful number - much more so than the one presented in (1) above. You can use it to determine round-trip propagation time in EME or satellite communication - or estimate the wavelength of a frequency which falls outside the HAM bands - like 11m for CB.

>How about a pointer to one of these less than $100 8051 simulators!

I don't know about that ... I have a commercial one called "avsim" and it's excellent.

However, I've got a PD cross-assembler for the 8051 family, that I would be willing to E-MAIL to anybody who wants it - it originally came from UseNet. 8051 applications are typically simple enough that a full simulator is not truly necessary, as long as you've got a little assembly experience.

Once again, let me stress that you can get an 8051 controller up for the $20-30 range (a fairly minimal system, true, but a fully functioning one). It is VERY well suited for ham radio projects -- I am always looking for good ideas !! If anybody can think of a worthwhile project, let's kick it around a little.

Fellow in my office came by, asking if I knew where MININEC was available from. I mumbled something about the Navy out in California, but that's all that I could remember (from a `cold' start).

Scanning through QST, we saw several `improved' versions, or outright replacements for MININEC, but nothing that gave an overall picture of the availability of the basic routine.

Is MININEC sold by the Navy, is it public domain, etc.

Any comments would be welcomed;

Paul Nix (WB5AGF)   InterNet: nix%muppet.decnet@consrt.rok.com

MININEC is produced by J.C. Logan and J.W. Rockway at the Naval Ocean
Systems Center, San Diego CA, 92152-5000. A description and basic code
listing for MININEC 3 is contained in NOSC technical document #938, dated
Sept. 1986, which is approved for public release. I do not know if a
newer version has come out since then.   73, Ken, WA3WHE

The main problem with CB is that the equipment is naturally
a microphone environment. Once the Cub gets hold of a mic then
there is no reason to learn the code. Using the mic is easier,
more efficient and more fun than wracking ones brain trying to
decode code.

Try getting using the sic. Radio Shack Space Patrol walkies
at distances which prohibit voice communications. Better yet,
increase the feedback in their regens to the point where
voice communciations is impossible due to the detector whine.
They will be more sensitive and will provide an automatic bfo.

The following is a posting I made on talk.politics.mideast.
This is in response to an obvious racist!
I do not think that ham radio should be used as a front
for some racist group. Ham radio should be used to
unite people.. not build walls between people.
****

I am insulted as an Amateur Radio Operator by the ARF
postings!!!

```
     Amateur Radio is not , and was not intended to be used as
     an identity for some RACIST NUT who identifies himself
                              ^^^^^  ^^^
     as:  (ARF).Amateur Radio Forum (ARF) NR9Q
```

Amateur Radio is intended to bring countries and people
together.
I would like to give you a very good example!
in March 1990, in Torremolinos Spain at the international
amateur radio union meeting , a delegate from Israel
announced that the ban preventing Israeli amateurs from
talking to Arab nations had been lifted.
It was received with a standing outburst of applause.
The Israel hams, and also the Israel government are
setting an example of the way Amateur radio should be used!

You should also be aware that in many Arab countries
you can be hanged for establishing radio contact with
Israel. It is considered as "espionage" or treason.
Here is where I justify my posting as mideast.politics.
Why is it that just about every where in the world
Radio Amateurs are allowed to establish radio contact
and make friends over the air... but in most Arab
countries this is not allowed. (Jordan is one exception)

While I have not traveled as much as many people on
the net, I have been around and have talked to many
Amateurs in the world, both in person and on the air.
This attitude is NOT prevalent among Amateur Radio

operators, so do not use Amateur Radio to identify
your Racist remarks!
     ^^^^^^
If you want to make up an organization to show how
big and great you are why don't you use the name
OINK for Obnoxious, Idiotic, Naughty, Kids. Think
of the large number of Naughty kids in the world! Much
more than the number of amateur radio operators.
This name would reflect more of the mentality of
your postings, and at the same time afford a word
that would identify you in a more appropriate
fashion than ARF.
Unless the "ARF" stands for the barking sounds that
the mad dog that you are makes, please do not use Amateur
radio as a shield to hide yourself behind.

I offer my Apologies to any PIGS and DOGS offended by
this posting identifying Schmidling with them.

Hi; I am planning to buy a 2M HT; anyone got any advice?

What I want::

1) Lots of RF output (3 watts minimum). Dont care about low-power position because i doubt i would ever use it.
2) Big battery packs (enough to give 30+ hours on receive standby, 1 to 2 hours on transmit without changing battery pack)
3) External 13.8v power lead for mobile use.
4) Battery chargeable from 13.8v mobile supply; radio useable while being

charged from mobile supply.
5) Splashproof, rainproof, drop-proof case, pine-needle-proof,
(diecast aluminium case and rubber seals ESSENTIAL)
6) High-selectivity front-end to prevent crossmod and image interference.
7) Robust belt-clip or shoulder-holster for carrying.

What i DONT want!

1) Wide-band coverage (either transmit or receive!)
2) Scanning or priority channel.
3) More than about 3 memories.
4) PL tone
5) Keypad frequency entry (they get damaged when sat on)
6) front-panel LCD frequency displays (they get smashed.....)
7) Hands-free operation, boom-mic headsets etc.

What I dont care about;

1) Weight (it will go in a rucksac)
2) Appearance.
3) Compatibility with any existing accessories (dont have any!)

I've been thinking of one of the Alinco DJ-series (DJ120) even though it has
a few things that i dont want. Anyone know if these are 'bomb proof' as far as
images and crossmod. are concerned?
Other alternative is an IC2 second-user, or a TH26.

What say you good people??

Anyone who is interested in tapping into this source can do his share by
becoming acquainted with, and participating in, the 33rd Scout Jamboree-
on-the-air (JOTA). This is a Scouting activitythat is scheduled for
October 20-21, 1990. This is an attempt to acquaint Boy Scouts with Ham
Radio. If you are interested, contact your nearest scoutmaster. You can
also get information on JOTA from W.W. Dansbury, W5URI, Trustee, K2BSA,
5805 Walla Ave., Ft. Worth, TX 76133 (817) 292-5019. Ask for information
on the 33rd Scout Jamboree-On-The-Air.

Yes, Yaesu sells one. It cost about $40 if I recall correctly.

I however, being a ham and too cheap to buy one, hacked a connector into
a $12.95 AA alkaline pack.

I have heard, but cannot recall the source, that 440 Mhz is MORE dangerous
than 1240 Mhz, watt for watt, due to an absorption peak in biological tissue

around the 70cm band. Has anyone else heard this?

Yep, all amateur SSB communication below 10 Mhz uses it. :-)

(hint: it's called lower sideband)

Ahhh, a language bigot and a very uninformed one to boot. If you understood the architecture of the processors and the implementation of BASIC, you'd never make such a foolish statement. Garbage collection on a microcontroller - what a riot.

[crazy picture omitted to save space]

>Would something like this work? Yes? No? Why?

When I lived in an apartment (i.e. until 1 week ago) I tried all kinds of crazy stuff like this ... my favorite method was to run a long wire along the ceiling, 1/2 way around the room (in other words, from one corner to the opposite one), and down.

I'm pretty inexperienced when it comes to antennas, but my thoughts on the matter are that some sort of tuner is necessary (I spent ~$100 for mine - I specifically looked for one that tuned random wires), and that random sorts of wires work best if you pick one plane and try to stick with it, or at most two planes.

On the other hand, I *NEVER* had good luck with indoor dipoles; they would only tune with the transmatch with great difficulty. This suggested to me that the effeciency of the operation was very low.

Another neat effect to watch out for: in one RIT apartment complex, 10 meters at a few watts *WILL* set off the fire alarm :-) (I never tried to do it from across the street :-))

73's and best of luck!

|>why I usually use low power, which doesn't give me headaches. The
|>same thing happens to my friend with a comparable radio.
|>--

I noticed that, too.   Especially on 440 and not as much on 2m. I
use an external antenna and a speaker mic. at every opportunity.

I recently bought a used Hustler CGT-144 collinear antenna for 2 Metres and
of course, it doesnt have tuneup instructions.
This antenna seems to be a 1/2 wave whip atop a phasing section (and possibly
radiator) about 1/4 wave long, all atop a shortened 1/4 wave element.
How do I tune it up? There are length adjustments on the bottom and top of the
phasing section and an adjustment at the very bottom. If someone who has one
of these beasts could paraphrase the instructions for minimum SWR, max smoke,
I would appreciate it.

And yes, I drilled the hood and put a large Hustler 3 bolt mount there. (
('77 Rabbit, so I guess I didn't hurt the re-sale value too much :-))

I haven't received much in the way of digests lately, so maybe you better
email me direct and I'll post to the net if anyone else asks.

Regards, Stu Beal, VE3MWM, (U009@CS.CCIW.CA),
National Water Research Institute,

Ok.. I'm just about ready to get my license again.

My original license expired in April '83.

I was told by a ham here at work that I could request my old
call-sign if it hadn't been issued to someone else.

Is there any truth to this? If so, how do I go about it?
I'm going to be taking my Novice test from hams here at work
and hopefully take my Technician test in October.

Thanks --

John:

Perhaps you would be so kind as to explain why I got so many of these
garbage collection statements way back when I wrote basic (it was the
only high level language at the the time) for Commodore. I wrote an
editor in basic and garbage collection would occur and I would wait
for many minutes. I program assembler on fifteen different processors
the last time I counted, and have written code for more computers than
most people even know exist. I do not consider it to be a sin that
I do not either know or understand what you are talking about. How about
a little information and a little less snot?

Bob

A few comments here ... tied-in with the "why'd my Astron Power Supply shut-down" `thread' (perhaps more properly this should be considered a `detour' titled "why you might have too much RF in your shack").

One of the guys, who responded to the "why'd my Astron PS quit?" `thread', made mention of his having been fiddling with his MFJ tuner when his Astron PS shut-down (his PS recovered when he cycled it `off-on').

A few months ago I was shocked (!) to realize that my little MFJ antenna tuner (I think it's a 941C ... it's about 8 or 9 years old) HAS NO RF INSULATION between the `hot' tuning capacitor shafts and the plastic knobs on the front of the tuner.

The plastic knobs ARE THE INSULATORS!

I noticed this after observing that, while `tuning' my balanced-fed dipole on 24 MHz, the reflected power (on my nice old Drake power meter) changed a bit, when I touched the MFJ's knobs, as opposed to the meter reading when my hand was away from the tuner. I pulled the MFJ tuner's top off and, "hmmm ... where's the insulators?".

It seems reasonable that, when that sort of situation exists, it's likely that the RF level in the shack might momentarily rise when your hands can act as a local radiator, perhaps enough to `trigger' an unexpected shut-down of an overly RF-sensitive power supply?

Does anyone out there have Alinco DJ-160-T out-of-band mods? I've been planning, but since my C.O. is out of town, I can't even get the info from Alinco legally until October........

Also, any opinions on Alinco rigs (specific or general)? I've been fairly happy with mine, but have had some problems with accessories (the wall charger that put out 31v at 5A was a good one).

Well, I gotta go for now.

73s,

KB2JAC/9
Todd Perry
PERRYR@WABASH.BITNET

P.S. In Indiana, call plates are $2 more than regular plates. They never had a problem with an out of state call (see mine), although I had to convince a dizzy blond at the counter that ham calls didn't HAVE to be XX9XXX or something like that..... RTP.

```

Hi there. Last night I was playing with the R7000 in my home in NJ and came upon a very strong (signal strength 9) signal at appx. 158.04 Mhz. It sounded like an unmodulated carrier, but the ODD thing was that it was sweeping from about 158.01 to 158.06 Mhz approximately every 10 seconds. This was around 12 midnight. This morning the signal was gone.

I checked around the house - unplugging things - and the source was not there. I also double checked it on a Bearcat BC205 handheld scanner and the signal was there too.

Very strange. Whatever it was, it seemed VERY close. The time of day made me think it might be some sort of wireless security system, but the sweeping action makes no sense to me.

Any ideas?

Lou

Wow, there's a subject I haven't thought about for a long time. For those of you who don't know what a Nuvistor is, it's a tiny vacuum tube which was the last gasp of thermionic technology in the fight with semiconductors for the general-purpose amplifier market. Nuvistors came in tiny little stainless-steel cans delibrately designed to look like transistors.

There's a small bag of them in my dad's workshop, unless he threw them away.

I'll see if they're still there. What are you planning to do with them?

Ultrasonic bug and rodent repellers tend to have spurious emissions in this area. The sweep rate tracks the sweep knob on the unit. They can be quieted by putting RF bypass caps (.01 uf) across the power supply jack and across the speaker (transducer). Their effective range is 500-1000 feet, so the unit should be close by.

Responding to an old thread -- I'm just catching up on back traffic:

Referring to spectrum space, you mention:
>   If a valuable limited commodity were not given to you for FREE (how do
>   you like that word now?), it could help reduce my phone bill, hence I'm
>   paying for your hobby through my phone bill.

In this you are stating that hams have been "given" spectrum space. I take an opposite view, and I am not a licensed ham, and never have been, so therefore could be considered to have a more objective viewpoint than a ham might. Who "owned" the spectrum in the first place? This is essentially the same as the question of ownership of any non-manufactured resource, such as land, ore, fish in the sea, etc. The actual truth is that whoever seized it first, and could enforce the holding of that resource, "owns" it. When someone or something with greater power comes along and takes it, there is a new "owner".

Given that viewpoint, I say that hams (speaking here in the broad generic sense of radio hobbyists and experimenters and scientists in the late 19th and early 20th century, not narrowly of the licensed amateur) actually were the first owners of the spectrum. Their efforts made it available. When technology made it more accessible, governments imposed themselves upon the scene and seized control of this resource. So your argument is false -- it's not that the hams have been "given" anything; it's that the vast majority of what they had was taken from them, by force (since everything governments do is by force, in reality), leaving them only a few crumbs as a token.

And, as a secondary point, since the subject of this discussion was "Costs": One of the primary reasons that amateur radio is valuable as an emergency communications resource is that the purchase, maintenance, and upkeep of the equipment and the training/time of the operators is free to the general public. It isn't necessary for tax dollars to be expended to buy and maintain the radios -- the hams do it themselves out of their own pockets. It isn't necessary to employ the operators, pay for their training and pay them for their time -- they do it themselves for no recompense. This same point came up on this list some years back in a discussion of disaster-relief efforts in third-world countries. In many cases, when catastrophes struck in such lands, and the emergency-relief supplies that were supposed to be in warehouses stored up for such an event were sought, it turned out that they were simply not there. The funds for their acquisition had been skimmed by corruption, or donated/bought materiel had been stolen and sold on the black market. If emergency communications had depended on such resources, there would have been nothing there to use. Ham radio equipment and operators, provided at no cost to the affected country and coming in from outside after the disaster occurred, provided more support than would have been possible if an "official" indigenous communications system were relied upon. While that is an extreme example, the "tax revolt" and budget crises in state & local governments here certainly limit the amount that can be spent for emergency communications that may never be used. Having free ham support appear in times of need is a most valuable contribution.

Regards, Will

>enforcement agency; KMA367, the LAPD call, is quite common around LA.

I used to see these all the time back in the early 80's during my commutes to UCLA and wondered what they were...kinda figured they were someone's callsign.

>
> I have a KA4993 frame on one of my motorcycles; I bought a used bike

>anyone can legally buy/display them...

Can I ask you why? What's the point of displaying the cops' callsign on your car? Maybe (as you say) to avoid tickets? Lotsa people out here have

SHOPO (State of Hawaii Organization of Police Officers, the cops' "union")
stickers on their cars for the same reason, I guess.

I found an old Heathkit AT-1 transmitter at a junk yard. The owner gave
it to me free. I brought it home, took off the cover, turned it on, plugged
it into a dead outlet, took bodily cover, and turned on the circuit-breaker
controlling the dead outlet. No explosion. No smoke. But the tubes
(it has three) lit up.

Does anybody know anything about this 4-band (80,40,20,10) CW transmitter?
Anybody have a manual or know of a source?

Thanks,
Tom Taylor AA6BR

I have heard that ICOM R1 is a tiny radio with a wide range of
receiving frequency.
Unfortunately it seems that it isn't available in the US yet.

I wonder if anyone knows of any way of ordering it from here (US),
Japan or somewere else?

Simple. Because the press cannot cover ANY topic without a very high chance of messing up on their facts. It was pretty sad to see how badly the press messed up when reporting 'facts' having to do with the Daisy/Cadnetix chapter 11 filings and so forth. Actually, having been involved in other issues (some of which the press is actively biased against), I was not too surprised to see how careless they were. Contrary to popular opinion, the press is not there to supply you with facts. Their first goal is to continue in business. Their second goal? Who knows! (And I bet that discussing it will devolve into quite a flame war, too.) (Notice that I did not say anything about 'profit', only about the survival of the business.)

In an attempt to forstall (forestall?) flames, when I say 'they' above, I do not mean to imply anything about any single member of the press.

Most all disclaimers should be applied to the above, also :-)

I've been having a great time working DX on OSCAR-13. I'm up to 27 countries worked since May, including China, Peru, USSR, etc., and while I've been licensed for many years, it's my first real DXing. Now it's time to get some of these QSOs confirmed!

When I QSL direct to rare DX, I include a self-addressed envelope, and one or two IRCs. I know many hams would prefer to get a "green stamp" (1 US dollar), as it would go farther, maybe to air mail or whatever, but I also know some countries don't permit their people to possess foreign currency and I certainly don't want to get anybody in trouble. Also there is the increased risk of theft. So I know one must be conscious of this, but I don't have a clear idea of exactly which countries should get IRCs only, and which ones are OK for $$. I hoped the Int'l Callbook would have some guidance, but no luck.

I'd appreciate hearing some specific advice on this subject, either by email or posting. Thanks and good DX to you.

>A prize will be awarded to the first person who can do this
>using _one_ wire.

Well, gee, my transceiver does it using NO wires - does that count? :-)

If you insist on just one wire, then -

```
                            wire
    [ your circuit]------------------------------------[your circuit]
          |                                                   |
          |<---copper rods                                    |
------------------------------------------------------------------------------
          |                                                   |
          |         Dirt and/or sea water                     |
          |                                                   |
```

There may be some range problems, and I'm sure it'd work better with
some really BIG batteries, but it IS only one wire! What'd I win? :-)

MARS is not a funny kind of ham radio named after a candy bar. Each service has its own program (coordinated at the top by a Joint MARS Chief Committee).

A ham may join the program of his choice, but it not as simple as learning the time and frequency and showing up with a cheery "I'm here!" You join by filing applications with the State MARS Director for your state. If and when you are accepted, you are assigned to a training net. Once training is completed, you will be assigned to one or more administrative nets and one or more traffic nets. Except for Navy MARS and ships at sea and for phone patching nets (both of which are tightly restricted), CONUS affiliate memebers are almost never permitted to exchange trafffic with stations outside CONUS. Even contact between the services is rare.

The training is primarily in handling traffic using the official NATO format and procedures, both of which are considerably different from ARRL NTS procedures.

MARS activity can be a satisfying, but there are two things to keep in mind: <1> it is NOT a hobby activity; it's a MILITARY program to meet military goals; <2> they want it done THEIR way and hams who join up with the attitude

"I'll do you a favor and show you how it ought to be done" will find
themselves invited to leave.

You were using the permeability with respect to vaccum rather than the
permeability. You need to multiply by the permeability of vacuum,
which is 4pi x 10**-7 Henrys/meter, or since you are using centimeter
units, 4pi x 10**-9 Henrys/cm. This gives an inductance of about 535
microhenries for the inductor you specified.

I originally learned Morse in the Navy, more years ago than I want to think about..

To graduate, we had to be able to receive and send at 20 wpm. On a typewriter. My fingers were taught to recognize the sounds. Most of the time I don't really have to think about it. (After listening to code for 2-3 hours a day for a number of weeks, some of us were sending code in our sleep)

I'm no longer that fast, but using Super Morse, I can copy fairly reliably at about 13 wpm with the computer keyboard. Unfortunately I am nowhere near being able to copy by hand at 13 wpm for General.

Nowhere can I find any rule that explictly requires that the code test be taken by hand, but I have been made to understand that bringing anything to the test but paper, pencil and maybe a calculator is forbidden.

Is there a rule, or is this just something became THE WAY IT IS DONE? I can understand that typewriters used to be big and noisy, but most of the new electronic typewriters are small and relatively quiet. Now if I could convince the VE's to allow a typewriter, I could be going for my General in October instead of Technician.

Anyway, thanks for letting me ramble on..

In article <suBwo1w162w@tosspot.UUCP> root@tosspot.UUCP (Lee Reynolds) writes:
>Can anyone tell me if simple frequency inversion scrambling
>is in much use (if any) at all on HF and up?

Ahhhh...well, yes, if you tune up ANY AM signal SSB and land on the wrong sideband, that's frequency inversion scrambling. Or just try copying a LSB signal in USB mode, or vice-reversa. "It's all the same."

No one with any serious interest in information security uses "simple frequency inversion scrambling", for the above reason. Lousy security. Cheap telephone scramblers do this, and descrambling may be too much for the kids down the street (MAY be!), but it won't keep anyone out who's at all seriously interested in penetrating your communications.

BTW, scrambling and cryptography are big no-no's on our bands. There are lots of private individuals and firms who have considerable (legitimate) interest in establishing private channels by such means, but Uncle Fox decided long ago that hams don't fall in this category.

If you're interested in further info on this, try sci.crypt. Scramblers aren't the big thing there, but you're likely to find some folks who know quit a lot about them.

> If this is true, I think we should all complain to ICOM.
>

I have seen the 'instructions' for opening up the transmitter on the IC-24... the instructions look believable so I beleive that it can be done. I don't remember the transmit range either (sorry).

The user must install two (I think, this is from my memory) surface mount diode arrays.... one array has two diodes with the anodes connected in common to a lead (this is a 'three' lead device)... the other array has the anode of one diode, and the cathode of the other diode connected to the common lead.... Of course, you then need to know where to install these, they are installed on the CPU board... near where the diode is removed to

enable the cross band repeat... There could be a little more to the 'mod' than
this... but again... this is from my memory, so there are NO guarantees to
the acuracy of this information.

Sorry.... I don't have the instructions...... But I will tell you that
the person I saw that had them got a copy from a major Ham Radio chain.
I assume that they will only give out the information to those who purchase
the radio from them ('tis only fair)... The first two initials of the
chain has already been mentioned... Don't tell them that I sent you!!!

Rich

REMEMBER: I don't have a copy of these instructions... Please DON'T email
me regarding these instructions.

Unfortunately, based on the prompting of a usenet reader, I went through the
whole ordeal of grabbing the products off of usenet and putting it on the pc.
I actually did a trial run of this earlier before sending it out to the
world and it worked, so much for confidence. My apologies, the error is in
the super morse archive zip file. I will work on the problem and try to
have a resolution soon.

sorry for the inconvenience,
mark

I just went thru the process of getting CA HAM plates for both my wife's and my cars. She is N6WSH and I am N6WSG.

After much confusion with the DMV people, my plates have arrived and my wife's have not. The fee was $21 each car. There is no other yearly fee. There is a $9 fee to transfer the plates to another car if you should buy a new one. It is not too supprising about the confusion over $20 vs $21. The form you fill out says $21 but the 'how to process this form' book that the DMV people use says the fee is $20. The lady helping me asked her supervisor which was correct and they finially decided just to charge the higher fee :-)

The main problems I had were:

* Confusion over both my wife and I getting plates. I tried to avoid this potential problem by submitting the applications seperately thru the 'drop off box' an the DMV, but they combined the two applications and sent them back with a note stating that there could be only one plate issued.

  I later solved this problem by submitting my application again and then submitting my wife's about a week later. This seems to have worked although we do not yet have the plates for her car. (We have the new stickers and registration however.)

* Application form does not indicate that you need to send in a copy of your registration. DMV says they need it. I made copies and re-applied. I included the suggestion that they change their form to indicate ALL needed information rather than just some.

* They wanted my current plates. Again the form does not indicate that this is required. I never did give them my old plates, and I also never signed anything saying that I would turn them in later. I now have two sets of plates for my car. I am not sure what happened here. I applied thru the DMV drop box to avoid having to talk to the DMV personal. If you talk directly to the DMV people they do want your plates. I didn't want temporary plates so I used the drop box.

Map error is intriguing! I wonder how many people (like me) who live close to
the state line really aren't living in the state they think they are.

[When I'm in a mellow mood, ask me about the Ohio-Michigan War of 1837, as a
result of which the state line was moved several miles north. My town went from
Michigan to Ohio.]

I don't mean to pick on you, but... this sort of note isn't helpful. Rumors, particularly extravagant ones, have a life of their own. Unattributed and unsupported stories have a tendency to spread and be mistaken for reality. The more removed from reality they are, the more likely this is to happen. The current ecofreak/deep-pocket-suing world is making this all the more likely.

There have been a few articles on this topic recently. In the past year or two, there was a detailed article in QST, with lots of references to professional literature, lots of caveats in all the right places, and so on. That was really useful. It helped distinguish what is known from what is merely suspected from what is known to be nonsense.

From what little I remember of the article right now, I'm suspicious of the headache story. I could believe it if reproduced in a double-blind test; without such a test, the psychosomatic explanation remains a good one.

>   KANSAS CITY, Mo. (UPI) -- US Sprint has expanded its Military
>Affiliate Radio System to allow military personnel stationed in the
>Middle East to call loved ones back home for no charge in the event of
>an emergency, the company said Monday.

Excuse me? "US Sprint"'s Military Affiliate Radio System program? Last time I looked, MARS was run by the Department of Defense!

>   The MARS program, which uses a combination of amateur radio
>operators and US Sprint's digital fiber-optic long-distance network, has
>been used as a calling program for military personnel for seven years.

Well, *this* is almost right. Sprint has been kind enough to grant us free use of their network during holidays for seven years, but MARS phone patches have been going on for a lot longer than that.

>   Medical calls from the hospital ships ``Mercy'' and Comfort'' and
>all emergency calls put through by the Red Cross will be completed for
>free, company officials said.

(quotes deleted)

>   Under the program, amateur radio operators in the United States
>will receive calls through MARS radio carrier signals in the Middle
>East. The calls then will be put into the US Sprint network and routed
>to their destination without charge.

This should say "MARS affiliate operators" (hams, of course, but they're talking about MARS patches, so the term should be that).

>   The MARS program has allowed military personnel to place free calls
>on Christmas, Thanksgiving, Independence Day and other holidays.
>   US Sprint is a unit of United Telecommunications Inc., which has
>headquarters in Kansas City.

This is not a flame against Sprint; we're grateful for their help.

But why in the h*ll can't the press cover technical topics without totally screwing them up?!

The main problem with CB is building a DF loop, buying a 55 gallon
drum of mouth soap, and using these to clean up the act of the
existing residents. The regular CB band is not the sort of
thing you want to expose Cub Scouts to.

Hi!

I just installed a 2m rig in my car this weekend. I definitely didn't want to drill any holes in my car and I didn't fancy the idea of a mag mount making a mess of my paint work, not to mention the messy wiring that would entail. I decided to go with an AS on glass antenna. Installation is a piece of cake. It took about 10 minutes. The performance might not be as quite as good as other antennas, but it works well enough for me.

While a punch works, it just doesn't have the thrill of using a hole saw. With the hole saw, you have to be careful about drilling through the ceiling material. You also have to keep the hole cool while cutting it, or the slug will drop onto the ceiling material. I have a friend that had a meltdown that way.

There is a commercial outfit here in town that lends their cordless drill and holesaw to hams.

I've got an HF6VX on the ground, with 32 radials. The lot is small, and the radials are under 30'. I don't have a dipole, so I can't compare the two. I get mostly US on 40/80. I hear the foreign broadcast on 40, and occasionally hear European callsigns.

The IC735 is a nice radio. I have used one that belongs to my friend, K7SS. (He is the guy in the ICOM ads for the 735!)

It sure is small.

I recently traded my IC 745 in on a new IC 735 and I am delighted. The receiver is great. The controls work intuitively. The transmitter is clean. It's small enough to take mobile or portable, yet the controls aren't cramped or difficult to use. It still has the transverter jacks on the back and has optional narrow filters and passband tuning. Short of the megabuck IC 781 or TS 950 you won't find a better rig.

Regarding HF-6V Butternut verticals.

I have had a HF-6V up for a year now and it has worked fine. I have not compared it to a dipole. On 40 meters I have 2 elements at 70'. I don't usually operate on 40 on the vert (only when the tower is down). There is a substantial signal difference (as one might imagine) between the two antennas. However, out of curiosity I have checked between the two several times. I can hear the majority of signals on the vert that I first find on the beam. The biggest exception is for European and deep South Pacific stations. Which I cant hear on the vert. For USA and South America the vert is fine. On 80 meters working the Carribean is a struggle on the vert and forget Europe (from the West Coast that is).

The vert does require a ground radial system. I have a six radial system with several more short radials. Two of the radials wind around the yard to get me 160 meters. (on 160 I have worked only north America and Hawaii). Until I got a decent ground I had RF in the shack and bad problems keeping the computer stuff working. If you can't get in a ground radial system then use dipoles.

I found the Butternut to be mechanically satisfactory and easy to set up. For North American contacts I have been fairly pleased with its performance.

If you are thinking about only 40/80 then you might think about the HF-2V. Its longer length will work better on 80. Buy the 160 coil too, you can have fun there too.

Regards, Dave

Our repeater group is using a 35A at our site. We have found that the wildly varying AC flucuations at the hilltop cause the Astron to crowbar (less than 1VDC at the output and hot hot hot heatsink). We now employ a timer that every 6 hours cycles the AC off (to the Astron) for 1 minute. B4 this timer we would have to go to the hill to cycle the supply off of the battery back-up.

Hello,

I recently purchased a rig that includes 6 meter capability (Icom-726) but I don't know much about it. I've scanned the ham portion of the band at various times of day and night and have not heard anything. I've heard what sound like commercial communications below 50 Mhz as well as telephone conversations between 46 and 47 Mhz. Can anyone tell me more about what I should be getting between 50 and 54 Mhz as well as between 46-60 Mhz? Do any books outline the activity there? I know there exist FM repeaters in the ham portion and some SSB activity below 51 Mhz. but I haven't heard anything yet (and yes, I do have an antenna at least for receiving).

Also, I'm interested if anyone has any suggestions about antenna design (base station) or a good inexpensive commercial product for 6 meters?

Thanks in advance,

Jon Neher

I'm curious about this. I have never got a headache (that I remember) from an HT, however, I do remember a time when using a radar gun in a car that caused a problem. I had been using it for a few minutes and had a mild headache. I picked up a friend of mine, and he played around with it for a bit, and soon said "Boy, do I have a headache all of a sudden." I put 2 and 2 together and thought that maybe it was from the gun, although I seriously doubted it. Anyone have any other experiences along these lines? Note that it wasn't being pointed out the window, not at us.
"Believe it, or not?"

Dear net people...

Thanks alot for all the replies people sent to me via e-mail and as replies to my posting.

I get the message! Everyone has confirmed my suspicion that the "shutdown" of my ASTRON power supply was caused by large RF in the vicinity. And this being casued by high SWR in the process of antenna matching via my MFJ antenna tuner.

Most people told me that the Astron was able to recover by powering off and then on again. This didn't help me. My astron is dead and currently out for repairs. Should be back in a few weeks... and I'l post info as to what was "blown" and how much $$ it cost to get it fixed when it comes back.

From the number of replies I got, this Astron "shutdown" seems to be a common problem with many people. If you don't have this problem you're in good shape... but you might want to be aware of these potential problems.

Maybe the ASTRON people should warn you about this. Or, maybe every ham except me knows about this "RF" problem with power supplies.

Below is a summary of all the replies I received, via e-mail and otherwise.

Live and learn....

Original note follows.... Replies are delimited by ///////////////////////'s

Subject: Weird Shutdown of my Astron power supply while antenna tuning (RF?)
Riddle me this...

I have an Astron RS-35M power supply (12v @ 35 amps). A few days ago, using this with a HF rig,I was "tuning" my dipole with a MFJ 949D tuner II at low power (about 5 watts). In the course of setting the inductor selector and antenna matching capacitor on the MFJ tuner the Astron simply "shut down". The Astron has amp and volt meters and the voltmeter which always reads 13.8 volts was reading only a few volts. I shut the Astron off, turned it back on, and agin it showed 13.8 volts. No fuse was blown, no smoke.. and I doubt that in the course of tuning by transceiver it was pulling no more than about 3-5 amps.

This happened a few times. Each time I turned the Astron off and then back on and it was fine. Three times and I gave up since I knew something had to be wrong.

Tuning another antenna this evening (a long wire) it happened again. Low power, CW, key down, 5 watts and the Astron shut down - this time for the last time. It didn't recover. Its "red" power light is on, no fuse blown but no voltage.

My guess is that the problem has something to do with RF getting in the power supply - what else could it be ? Clearly, pulling a few amps for antenna tuning wouldn't burden this 35 amp supply and no fuse was blown.

Looking at the schematic of the power supply I see 3 curious capacitors in various configurations on the heat-sinked power transistors with the note "C7-C9 added for R.F. bypassing".

What does RF have to do with a power supply. And, why has my Astron "shut down" on such a low power demand ??????????????????????????????????

Wondering....

Anybody got an answer.... or a guess ?
  Gary (N9KAW)
//
From: jpd@pc.usl.edu (Dugal James P.)
Gary, the Astron has an LM723 voltage reg chip (if I recall correctly). It has sensing inputs to account for internal voltage drops. I bet RF could confuse it to where it puts out less OR MORE voltage than desired. If the voltage gets too high, a crowbar SCR will short to ground the output, so as to blow a fuse. So if it's not the fuse, suspect either the SCR or the reg. chip. Since the chip is socketed and cheap evan at Radio Shack, try replacing it!
Good luck!

Most likely what's happening is that you have some RF floating around in your shack and the diodes in the power supply's crowbar circuit are rectifying it and causing the crowbar to clamp. You have to turn the power off and then back on to reset the crowbar. You can help alleviate the problem by installing a .1 uF cap across the positive and negative terminals on the back of the supply for a start. The better idea is to work on your antenna to get a better "natural" match without having to use the tuner. The worse the antenna's match, the more RF you'll have floating on the outside of the coax, in your shack, etc.

Welcome to the world of RFI!! I have an Astron 35 A supply, too, though without the meters. When I operated on 40 m, it shut down, but recovered when the RF stopped. My solution? Tear out Astron's regulator board and build the regulator for the 30 A supply in the ARRL handbook. I really tried everything I could think of before this with no luck whatsoever. The regulator I built from the Handbook works like a charm and is IMPERVIOUS to RF! Takes a couple of evenings, but well worth the effort.

I never tracked down what was happening, but in your case it sounds like the crow-bar overvoltage protect has tripped, which can only be reset by cycling the power to the supply. Good luck!

73, Kim Elmore (N5OP)
//
From: geertj@ica.philips.nl
All kinds of weird things happen when HF goes innto a power supply. Be glad

the voltage didn't increase; I have seen that happen with a professional
lab power supply (it wasn't a PHILIPS, if it matters..)

Make shure that no HF reaches the power supplies electronics.
Some toroids and a few caps of 10nf is usually sufficient. While at it,
add a crowbar: a circuit with tyristor and zener diode that will SHORT
the power supply when the voltage gets too high (mine usually go at 18V
for 13.8V supplies. A fuse will do the rest, and save your rigs.
They smell real bad after overvoltage damage. Expensive too. It can
always happen: I have had problems on a power supply that worked for years
but didn't like the power we made during last JOTA..
73, Geert Jan
//
From: swm@homxb.att.com (Scott W Mclellan)
Gary,
I have had the same exact experience. Due to a problem with my tuner,
my rig was hot with RF. Either the RF caused the regulator in my
astron RS-35M to increase the output voltage until the crowbar
activated or the crobar was tripped by the RF. Turning off the supply
reduced the output current so that the crowbar reset, and turning it back
on returned everything back to normal. My solution was to ground the
negative terminal of the supply to the Astron chassis and increase
the bypassing in the regulator. The output of the Astron is floating
with respect to ground (a couple of small bypass caps couple the output
to ground - not enough in my opinion) so grounding the negative end
helped a lot. I also increased the bypassing of the AC inputs and put
a line filter with MOV protectors in there too. Not only did the RF
sensitivity of the Astron decrease, but it is now less suseptable to
lightning surges and the radiated noise from the transformer/rectifiers
is a lot less (but thats another story). Also ground together the
supply, your rig, and the tuner with a short braded cable coupled
to ground (through as short a wire or braded cable as possible).
All ground cables should be as short as possible. Put toroid cores
on the cables in and out of the supply. This completely solved the
problem for me.
BTW, I evolved to a battery supply now instead of the Astron.
Great for emergency work and there is no way I can overvoltage my rig
now.
73 de ND3P
/////////////////////////////////////
I have the same supply, but mine doesn't shutdown when I'm using my
MFJ tunner, it usually goes south when I power up my FT901 initially.

This is nothing if not a nuisance. I haven't looked for a solution.
I just sequence it off, FT901 on, then power the supply back up.
If you find an explanation I'd be interested.

73's de Steve KA6S
//
To Gary and his Astron power supply.

Yes Gary it is very possible that your supply shut down because rf was getting
into it. The power supply on my Drake TR-7 does the same thing when my antenna

is not tuned correctly and rf is in the shack. The capacitors you talked about and I'm not sure from your posting if they were installed in your supply or not are probably bypass caps to reduce the susceptability of your supply from rf.

It is possible that the power supply leads are acting as antennas and picking up rf in the shack. Try to put a sleeve of ferrite over both leads. This will reduce the common mode noise that is the rf common to the plus and minus leads of the supply. If you need more info try to call me. I tried to e-mail direct to you with no luck.

From: scotto@crash.cts.com (Scott O'Connell)
While I have no first hand experience, I have been told by several folks that they've seen poorly constructed Astron supplies. One fellow found the AC line wired backwards while yet another found an area that missed solder completely!

Is it possible that maybe you've got a marginal connection in the supply?

DISCLAIMER: I'm NOT badmouthing Astron. I'm just relaying comments I've
         heard in the last few weeks regarding their assembly.

//
From: glenne@hpnmdla.HP.COM (Glenn Elmore)
I have an Astron (and schematic) at home too. So this *is* a guess. I suspect that you could easily have generated some pretty big local fields with the tuner and the longwire. The impedance of the longwire could certainly have been high and that probably made for lots of RF voltage in the shack. Whether this was coupled into the Astron via the DC output leads, the power line or directly radiated into the box I don't know but it probably was one of those. The source impedance of the supply at RF is not guaranteed to be low (thus the extra bypasses?).

I don't know what the failure mechanism was exactly but I think it is a series pass supply which means that the output might be pulled above the desired regulated voltage. I suppose there is an overvoltage circuit which could have turned on. I'm not clear on what the precise failure sequence was but maybe there is a crowbar that got turned on and the supply tried to source current into it and broke something. With the RF present in regulator, over-voltage and over-current circuits it seems like almost anything could have happened.

I hope it didn't over voltage your radio. I fried a 432 transverter that way one time and I know of others who have lost HTs to the same fate. Good power supplies are *not* trivial.

Sorry to post this, guys, but I can't email from this location.

To: Gary, N9KAW

Gary, I have had the same problem with my Astron 35M. The SCR in the unit sees the RF as an overvoltage and crowbars, shutting the output down. Turning the unit off and on again resets everything. I solved my problem by wrapping the DC leads going to my xcvr around a toroid.

Craig, KA5BOU

//

I repaired an RS-20A once for a friend of mine who had the same problem you describe. He was using it with his ICOM 751A. As he raised the RF power on the ICOM, it would hit a treshold when the power would cut back and the voltage from the supply would drop.

The problem was one of the 2N3771 pass transistors (on the back heatsink). The socket that encapsulated the emitter and base leads did not make a very good connection and could not handle even a light load (like your 5 W situation). So, as a first look, check the connections to these transistors.

Also, since these transistors are, in essence, connected in parallel, you might try removing all but one (I believe there are 4 on the RS-35M?) and see if your voltage returns to 13.8 V (no load connected). You could replace one at a time to see whether one is not working.

Good luck -- hope this helps.

73,

Doug, WW6D

///

This is a common problem with regulated supplies. Especially with long wire antennas, it is common to see RF voltages in the hundreds of volts floating on the equipment. This is where having an effective RF ground on the station equipment saves the day. The Astron 35M has some RF suppression builtin. There should be a .001 cap across the output terminals and one across the 110v line along with three MOVs. Also there are three caps surrounding the pass transistors. Check that these caps are there and are good. I recently had a lightning strike come in and vaporize the cap across the AC line (and the MOVs). Interestingly all four pass transistors survived, but the .01 ohm 5 watt emitter resistors didn't. These act to equalize the current between the pass transistors AND act as the metering shunt. These proved impossible to get locally. One foot of number 20 wire has .01 ohm of resistance and works nicely as a replacement. You may have blown the LM723 voltage regulator in the supply with high RF voltages. It can only stand 35 volts. Try replacing it (use a socket) and be sure to check the caps and establish a good RF ground before tuning up again.

Gary KE4ZV

///

From: mikey@pnet01.cts.com (Mike Shirley)

Our repeater group is using a 35A at our site. We have found that the wildly

```
varying AC flucuations at the hilltop cause the Astron to crowbar (less than
1VDC at the output and hot hot hot heatsink).  We now employ a timer that
every 6 hours cycles the AC off (to the Astron) for 1 minute.  B4 this timer
we would have to go to the hill to cycle the supply off of the battery
back-up.

Look through Circuit Cellar magazine, for example.  Or to quote a data point,
try looking at pg 60 of the 1990 Active Electronics catalog: there is a
68HC11 single board machine w/monitor, i/o ports, etc for $168.11.

Or course, you could go even cheaper by whipping up your own controller
based on the 68HC11 - the parts go as cheap as $10.90.

Cute. I got stopped when I had my sticker in the window, like it
says, but he didn't see it. The cop stopped me, then saw the sticker,
but checked my DL, and asked me the reason for just having the
sticker. A good waste of my time and his. If I were you, I'd try to
fake or locate some cardboard "dealer plates". I got plates within my
two months, but they were somebody else's, not N6TQS.
It took another 6 weeks to get my plates.

Subj: What's a Techie? (followup)

Thanks to all who responded. I guess I'm a closet techie, after all, even if I do support the CW requirement. I guess the fact that I have built my own transmitter, and modified some military gear to operate on the Ham bands, and constructed my own working antenna from plans in the ARRL books also qualifies me for the title "homebrewer" also. Darn, I still haven't learned how to build a TNC, though, so I'll just have to go out and *gasp* buy one.

Seriously, I do think that a good portion of the fun to be derived from Ham radio is in the building of equipment and the satisfaction that you can get it to work (even if it takes much "debugging"). I'm grateful that we have some airspace in which to do this, especially with transmitters that can put out more than 100 mw of power (up to 1.5 KW) right out of your own brain/junkbox/workbench!

I'm with Myron: Homebrewing is building something, not connecting store-bought stuff together.

73, Dube N5PDK

PS: "Store-bought stuff" is functional stand-alone equipment, not basic components!

I just got an AEA PK-232MBX Multi-Mode Data Controller and my intention is to use this with a Kenwood TM-731A (2m/440) and a Mac.

I though I'd be on the safe side and solicit the net ham-radio/community regarding this setup and any potential problems.

The AEA does not have specific instructions for the Kenwood TM-731A but the Mic wiring *seems* clear. But, on some KW models the recommendation is to add a 0.1 mf cap in series with the mic audio in. No reason is stated and my specific model is not addressed. Do I need this and what's it for ?

Also, the pins on my KW are as follows: 1-Mic audio; 2-PPT(STBY); 3-Down; 4-UP; 5-8v/Max 50ma; 6-RX Audio output; 7-GND(Mic); 8-GND(PPT)

The AEA wiring diagram/cable wants a "brown" connected to the "common" PPT and Mic ground. But, these are 2 separate pins on my mic connector. I took a VOM and found that pin 7 (GND-Mic) and pin 8 (GND-PPT) seems to be tied together internally. Further, the AEA guide recommends connecting the cable shield to pin 7. This leads me to believe that "brown" and shield should all be tied together to pins 7 and 8.

If someone could help me out with this - I'd appreciate it.

=> Do I need any 0.1 mf cap in the circuit ?
=> Are pins 7 and 8 wired together in the Kenwood ? My VOM seems to think so, although these are separate pins with separate designated functions as diagramed in the KW manual.
=> On the Mac serial interface. Do I need all the pins connected (1,2,3,7,8,20) or can I get away with just 2,3 &7 (transmit, receive, ground)?
=> Will I have a problem with "switching" times on the Kenwood?
=> What can I "blow up" if I hook this up incorrectly?
=> Any problems I should look forward to using the PK-232 ?

One other minor question, the Mic input impedance for the KW is 500-600 ohms. Nothing is said on the AEA specs about audio input levels or impedance matching for their AFSK output from the PK-232 into the transceiver. Isn't this important ? I would think so, the wrong impedance or "overdriving" the mic input, I would think, has the potential to doing some damage to the transceiver audio pre-amp/front-end... Right ?

Thanks,

Hmm. I CAN NOT in good conscience suggest that ANYBODY fool with BASIC unless they're SURE the project is SO small that it's REASONABLE; otherwise, when BASIC decides to garbage collect (or equivilent idiotic operation) and things grind to a halt, you'll wind up frustrated.

However. The 8051 family of microcontrollers by Intel is nice; my friend Mike and I are building a keyer out of one. For <$50.00 in parts and a little bit of planning, we will have a keyer with 4Kbytes of battery-backed up memory and an LCD display (for telling you what's IN the memories).

The 8749 is a version of the MCS-51 series (where the 8051 comes from), that has an EPROM built into it. It's QUITE reasonable to buy an 8749 for $15.00, a crystal for $1.00, and build a repeater controller for under $30.00. Think of the countless microcontroller projects that can be dreamed up! Callsign displays, weather stations, touch-tone pagers/decoders -- you could scare up a RTTY receiver with a display for under $30.00 in parts and do it in software!

I wish I know more about radios and how they work ... but it's easy to think of myself as a homebrewer, not afraid to try anything in the digital genre. Maybe I can convince others to do the same :-)

But Item 1 will guarantee that no product will ever exist. Without a bundled
application that interests the armchair ham, no hardware will ever fly.
And if the hardware does come bundled with an application, then it
apparently won't qualify for your interest. Sounds to me like a PC with
a data acquisition card and maybe a smart async card will fit your bill.
That's about as standard a hardware environment as is likely to exist
in the forseeable future.

>> Do your own homework, phil. Check any issue of "Circuit Celler", "Embedded

Maybe I lost track of the thread somewhere but weren't we talking of
embedded controllers for things like repeater controllers? I don't
read this thread much because it is mostly noise so I may have missed
something. If you are looking for network controller hardware/software
controller combinations, it is still hard to beat a PC with a smart
sync card. I just finished a system for a client in which we're
driving TWO 56kbps sync modems from Interactive Unix on a 386 PC
with 3770, SNA and RJE layered on top for good measure. The system
shows less than 10% additional load with both modems active. What needs
to happen is someone write driver code for the hardware that is available
now instead of just talking about it all the time.

>I've never heard of Micromint. Per chance might they have a 56001 SBC?
>You might also mention where these publications can be had, subscription
>prices, etc. I've only heard of "Circuit Cellar" and last I saw, it was
>a column in some magazine (was it Byte?). Remember, I'm a SOFTWARE

>person, NOT a hardware person. I don't get, or know about where to find, such things as EE trade rags and such. But I'm sure I can understand most of the tech talk in them.

Try your nearest university technical library in the periodicals section.

>As to getting my hands dirty with assembly language, it's MUCH better than getting them bloody with BASIC.

I think KE4ZV addressed this one adequately.

>If I want a high level language,
>I'll use C. Unless these SBCs typically run at 33 MHz or so, I'll have to go back to assembly to get the speed I want.

Say what!?! Look out beyond the PC bus world. A 2 mhz 6502 properly coupled to a UART will easily drive a 56kbps channel or 2. I know that a 10 mhz Z80 will. And any number of the speciality microcontrollers will handle bps rates we're interested in with single digit clock speeds. The world does not revolve around 5 mhz busses with 15 wait states associated with every I/O instruction. The PC architecture was brain damaged when it was conceived and 10 years of suffering has not healed any of the damage. The ONLY thing it has going for it is it is cheap and available anywhere.

>I do a LOT of programming
>in assembly language now and am very comfortable with it on several machines, so why should even consider BASIC? I hope I can get a refund for sending back the ROM chips with the BASIC interpreter on them.

Depends on whether you are programming just for the fun of programming or whether you are programming with the aim of getting the job done. If you aim to get a given job done with the minimum effort, then BASIC (or maybe FORTH if you love pain.) makes a hell of a lot of sense. Remember that you don't have a nice DEBUG command or even a TTY line with these little processors. In the absence of BASIC with its attendent TTY interface, you get to do things like toggle a bit on a port for every pass through a routine in order to determine where you are in the code. Not my idea of fun even with a moderately good function library available to me. BTW, the BASIC or FORTH comes mask-programmed into the devices so you can't get a refund. You simply buy a device without the BASIC.

John

If you have a Yaesu FT411 and you do the mods, beware that you will lose ARS and auto-leading-1, plus erase your memories. Here's an annotated version of the mods information, with some missing information the original author apparently thought was too trivial to record (sigh). I mailed a copy to Bramwell.

Date: 16 Feb 89
From: rfc@briar.philips.com (Robert Casey;6282;3.57;$0201)
Subject: FT 411 mods   [comments added by Alan Silverstein]

copied from packet:

```

24250 BN   2876    1 YAESU         4X6TL  890208 1513
Subject: FT-411 Modification.
```

From: 4X6TL@4Z4SV

FT 411 OUT OF BAND MODIFICATIONS

1. Open the front cover.

    (This was one of the hardest steps!

    Yank off the three top knobs. Remove all five top screws, the two side screws, and the four screws holding in the battery plate. Carefully pop off the top cover (there's a catch) by prying with a small screwdriver at the front left. Slide off the complicated top rubber gasket. I removed the PTT gasket and the carry strap too, but there's probably no reason to do so.

    Now the unit should fold open from the left into two halves joined by fragile ribbon cable. The carry strap T bar will fall out; remember to put it back later.)

2. Locate the CPU unit (it is located on the front cover).

    (There's a large copper sheet over it, with ribbon cable coming out the left side.)

3. Locate jumpers 1, 2, 3 and 4. These are the band setting jumpers.

   (They are at the lower left of the copper sheet, each a pair of semicircles of copper on the epoxy board, separated by small gaps, with white numbers above.)

4. Jumpers 1, 2 and 4 should be disconnected, and jumper 3 should be connected.

   (In my (US) unit only jumper 2 was soldered across. Removing the solder on jumper 2 was easier than adding some to jumper 3. It's hard to reach the jumpers. I held a piece of wire with pliers and touched the iron to that. I was sure to ground the iron to the chassis before soldering.)

5. Close the radio.

   (Whew!)

6. Apply power to the radio and turn it on. The display will initialize with memory 1 flashing and the frequency display will show 1.000.

   (And you can set any numeric value, it seems, even silly ones, using the dial, arrow keys, or keyboard.)

7. Now, adjust the display to the desired lowest receive frequency. When done, press VFO. The memory channel will now show 2 flashing.

8. Adjust the display to the desired highest receive frequency When done press VFO. The memory CH will now show 3 flashing.

9. Adjust the display to the desired lowest transmit frequency. When done, press VFO. The memory channel will now show 4 flashing.

10. Now, adjust the display to the desired highest transmit frequency. When done, press VFO. The rig is now set for your programmed band on transmit and receive.

    (It worked! BUT, I lost two features:

    1. ARS (auto repeater shift) is now absent. Apparently jumper 2 sets the US band plan and related features, as a package.

    2. Now have to type in the leading "1" for all frequencies, where before it was automatic.

    Also, the processor did a coldstart -- all memories lost.)

COMMENTS

1. After the rig is programmed to the band and you want to change it to other ranges, you will have to open the rig again and disconnect

jumper 3, then to apply power to the radio, turn it off again, open it again, connect jumper 3 back and repeat from steps 5.

(Not very likely I'll ever do that again! -- ajs)

Dunno about the 470, but my 411 runs just fine using a 6-pack alkaline battery case with a couple of wires routed out to a cigarette lighter plug. Gets a little warm on high power!

The radio is rated at 5-15.5V, and it works. It's a shame they didn't throw an external 13V jack on the unit, to avoid having to switch bases.

I had to have a cateract replaced by a plastic lens a couple a months ago.
I've owned a 440 5W HT with a rubber duckie for a few years, but I haven't
operated all that much. My parents and brother have had cateracts, so I can't
really blame the HT. Things can get real muddy trying to track down a
connection between health and radio.

I am looking for a MFJ-313 converter for my Kenwood TR-2500 HT.
It will allow me to receive 140-166MHz. Anybody have a used one
or know a place to purchase one? What is the approximate price?

Thanks in advance,

John McVey

Does anyone have the format of the AEA pk232 commands that can be
exchanged in "host mode". It apparently is in the technical manual
but alas I dont have it.
I would like my computer to talk to the pk232 at a lower level than
the normal method. I would also like to identify the source of the
stuff that comes back for the unit.
I would think the commands stay the same but are preficed with some

header.
Thanks,

(603) 881-0503

In article <141793@sun.Eng.Sun.COM>, Jonathan Neher, N6XUI, was asking what the 6m was
all about.

Well, you could pick up a copy of scanner frequency listings locally for the stuff between
about 46 and 50MHz. I don't recall off the top of my head if there are any Federal Govern-

ment segments wedged in there, but I do remember that many of the channels between
46.0 and 47.0 are allocated to Public Safety, such as Fire and Special Emergency (Ambulance/
EMS, etc.). The chunk between 49.6 and 50.0 used to belong to the Feds, and was used by
the various MARS groups, but it has since been given over to the cordless telephones.

The ARRL has published a band plan for 6m, and it's printed in the ARRL Repeater Directory.
However, I've paraphrased it below for your convenience. You should double check the FCC
Rule Book and other amateur publications to ensure you're operating legally.

(Some of the segments overlap slightly - there may be some local gentlemen's agreements)

```
50.0 - 50.100 CW ONLY (FCC RULE !)
     50.060-50.080 Automatically controlled beacons [List in ARRL Rptr Dir]
50.1- 50.600  SSB/AM
     50.110   SSB DX calling freq. (pls move off once contact made)
     50.200   National SSB Calling freq (Move off as above; down for DX, up for local)
     50.400   AM calling frequency
50.600-51.0   Experimental and Special Modes
     50.61-50.78   Meteor Scatter/Duplex, paired with 51.61-51.78
     50.70    RTTY
     50.8 - 50.98  Radio Control (of models), channels on 20(?) kHz raster.
 51.0 - 51.100    Pacific DX window
 51.1 - 52.000    FM Simplex and special modes
     51.61-51.78   Meteor Scatter/Duplex, paired with 50.61-50.78
     51.700   National Packet calling frequency
52.00 - 52.05 Pacific DX window
 52.05 - 54.0 FM Simplex and Repeaters, 20 kHz raster starting on "52.01" (grrr...),
          Repeater Split 1.0 MHz, high-in vs. low-in check locally
     52.49, 52.51, 52.525 FM Simplex, '.525 National FM Calling Frequency.
```

The September VHF contest is this weekend, September 8-9th starting around 1900UTC
Saturday, and running past my bedtime Sunday night. You might want to listen between
50.000 and 50.300 for the contesters.

I want to measure the complex impedance at the input of my HF antenna.
I've tried the typical cheap noise bridges that are available and have
not been satisfied with the accuracy or the range of the measurements.
What should I use?

A General Radio Impedance bridge sounds seems like a step in the right
direction but it is big and the used one I saw at a hamfest was $450.
What do these things cost new?

Is there a more modern way to do these measurements?

>Until I got a decent ground I had RF in the shack and bad problems keeping
>the computer stuff working.

This might explain why my Yeasu 767's ant tuner kicks in every
once in a while. Causes all kinks of problems with output power.

BTW: The Butternutt does look somewhat flimsy but don't let
the looks deceive you. I have had mine up for a couple of years

now and it has been hit _many_ times with wind gusts >90 mph with
no damage. I have lost sections of a cedar fence but not my vertical!

As an aside, does anyone have an easy way of putting radials under
the lawn (without a shovel)?

Here's the story: Lightning struck down at my qth, broke my tnc and
the interface inside my Kenwood ts-790a. Both main and sub audios are dead.
No output to the tnc. Anyway, I looked up the components which are likely to
have broken. They are two transistors: Q15 and Q16 on the main circuit board
(IF UNIT X48-3050-00). They turned out to be surface mounted transistors and
probably due to space limitations none of the surface mount components are
marked on the pcb. In other words, I have no means of finding out exactly
where they are located on the pcb, since it's got about 100 surface mount
transistors. Perhaps someone's got a service manual from which one can see
the actual location of these components?
Thanks in advance!

Please excuse my ignorance. If this subject is not appropriate for these newsgroups, please point me in the right direction.

I do some hunting in the Laurel Highlands of Pa. Last deer season we decided to pick up a few FM band walkie talkies to help us communicate when we're out and about. They were inexpensive, so we bought four of them. (We picked them up at a "hick" Radio Shack/Variety store and made a deal with the owner.) These are the small, pocket sized Realistic brand.

What I am interested in is whether or not we could find an inexpensive "base unit" for the non-hunters in our group. Ideally, I think it would have to be powerful enough to reach a 5-10 mile radius from the cabin. Another potential problem is the mountainous terrain; we have had problems in the past with transmissions from one side of a ridge to a valley.

My questions are: Is there a "base unit" available in the same frequency range powerful enough for the mountains? (BTW, the sides of the boxes say 49MHz.)

My friend that owns the cabin recently picked up what he describes as a base unit.(garage sale) Is it possible to change to the same crystal as the walkie-talkies? Assuming, of course it has one. Additionally, if this works, how can you boost the output? Do you just try to place a large antennae as far up as possible?

Even though all four of the folks using these radios won't be able to talk to everyone, I'd like the base unit to reach them individually. What would be the best, inexpensive way to do this?

Any help, advice, pointers, greatly appreciated. Please respond via email if possible. If you need more info, I'll be happy to supply it.

Thanks for the time and consideration.

Ciao,

Todd

I suspect a flashlight could go a long way on a clear night. Right now, I am working on my novice license, and I am very close to solid mastery. With a flash light, and key wired in, I suspect you could get out 2 mi of long distance. Problem is, you would not be working with sound, and filiment heat up and cool down time will slow you down.

I live enar a major port on the East Coast, and I was thinking that it might be interestig to try and signal ships comming over the horizon using car headlights (with a real key wired into the circuit) or just a flash light. I wouldn't try it until I fully UNDERSTAND MARITIME SIGNALLING protocols though. It wouldn't due to send misleading instructions to vessles in shallow water like that.

Paul

Progress continues on obtaining parts for the microwave internet link. Current plans are for working under part 15 rules on the K band (24 GHz). Anyone with a description of the procedure for obtaining an experimental and/or educational license for another microwave band (or preferably the same one), please let me know. If there is a demand, I will summarize.

My appologies if this is begining to stretch the intended subject matter of this group. I can't think of a better place to go.

This is from the icom "translated fax".

Usable ranges after the mods will be:

RX: 114-130, 138-192, 403-485 & 825-903
TX: 138-168, & 410-485

In reality I have seen a great variance between different radios on where they actually lock up but I have been impressed at the capabilities of this radio

I assume you already have done the kbd mod for the out of band recieve so I will skip that part.

Order the diodes from Icom, part number 912-06015. They are about $2.50 each. A lot for a diode but not for a mod. These are tiny tiny surface mount dual diodes. They have three legs each and I forgot to see if they were common anode or cathode. Be safe and order the right ones from Icom.

Open up the radio. Clip out the glass diodes D13 and D14. D13 should already be out to enable the rx mod but D14 will enable cross band repeat. Func-C,5,D will activate the cross band repeat between two *simplex* channels.

Install the two diodes at position D7 and D12. The picture below may help find them.

I used the hottest and tiniest tipped iron I could find, tweezers and magnifying glass. Be extremely careful adding these diodes as I have seen how easy it is to lift an etch.

```

Regarding extremely simple light-wave communications, headlights and the like, here is one data point:

Jim Schreckengast (now N0HAP) and I tried this, coordinating via 2m FM. The "transmitter" on each end was a single automotive headlight. He simply pointed the car in the right direction, and had a friend stand in front of the unused side. I had a separate lamp, a spare headlight I had mounted in a toilet plunger with a cord going to the lighter plug. Looked odd, but made for a bright, cheap, hand-held emergency lamp....

Anyway, "modulation" was done by a shield, *not* by cycling the power to the lights. I would suspect your baud rate would be seriously limited if you keyed the power (there is a noticeable decay time), and your headlights might not like such treatment. I suppose you might rig up some sort of Aldis lamp contraption if you were serious.

At any rate, what might be the most interesting was the QRM we dealt with. The distance was only about 1.5 miles, but we were on the sides of hills on either side of a valley. So, all around and behind us were other lights from cars, building windows, etc. Even with what would be an extremely low SNR (if you figured signal light flux and "noise" light flux within some solid angle), we had error-free communication. I imagine we had around 5 WPM, since that was as fast as we could accurately wave a cardboard shield back and forth.

At a dark site, with no moon and with your eyes dark-adapted, I'd like to see just how far a simple flashlight could be used.

Hi,

Does anyone have a mod for the HR-2600 that improves the AGC circuit. It is so slow to recover after releasing the PTT that I often miss a comeback from another station. Thanks.

Hello FT470 owners... I asked a few weeks ago about mods for the FT470 to make it receive and transmit on additional frequencies. I own(ed) the European version which caters for 144-146 & 430-440. It now transmits and receives 140-174 & 430-440, with additional receive coverage 440-500 MHz! The mod was fiddly as the chip resistors are the size of a pin head. You'll need a fine tipped soldering iron and about 2 hours of patience. Here's how I did it...

```
For 2 metres..  locate R66-69...      R69
which are located at 10 O'clock       |
to the lithium battery.           R68-(lithium
R69 is vertical, R66-68 are       R67-(battery
horizontal.                       R66-(cell
```

The combination you want is: R66 & R68 = 0; R67 & R69 = 1.

Mine came with R66 & R69 set for Europe so I just moved the resistor from position R66 to position R67.

For UHF, locate R70-72 to the top left of the ribbon cable. These are vertical and in the order:

```
     R71 R70 R72
```

The combination you want is: R71 & R70 & R72 = 0.

Mine came with R71 set for Europe so I just took the resistor out and have stuck it to the back of the battery (in case I need to convert back).

If anyone disagrees with these mods and think I've done something wrong, let me know a.s.a.p.

Cheers & 73
de Peter G6ZYT.
